

Module 1 (ER model)

Introduction to DBMS

Data - It could be any fact that can be recorded or stored.

Eg - text, number, images, videos, speech

Database - Collection of related data. (Only for text and number right now)

Text and number

images + videos

Traditional database

Multimedia database

NASA

Supermarket
(selling some goods)

Geographical interface DB

Real time database

Data warehouse - The data is huge and historical

It is a kind of database.

Database management system - Set of programs used to defining datatypes structure & construct (place the data in the harddrive) data & manipulate it.

Types of DB

- 1) Traditional Database
- 2) Multimedia DB
- 3) Geographical interface DB.
- 4) Real time DB

DB models in Database.

Modelling level

level 1

High level view or
Conceptual view

(E-R model)

level 2

Representational or
implementation.

tables or
~~SQL queries~~
~~Relations~~

level 3.

Low level or physical (how to store,
view.
datatype etc)

Introduction of E-R model

Entity Relationship

Entity

A person

Attributes

phone, address, name

Relationship

owns a

Things

properties of
entities

Association among
entities

Person

name, age, phone no

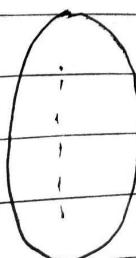

works for

Entity type - Entity → (26, Raj, Bks)
 ↓ (Schema)

PERSON (Age, Name, add)

extension

extension

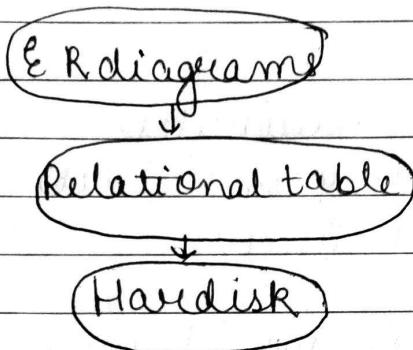

state of
database

6

Schema - heading (how do you represent)

ER diagrams → Entity type.

fall a communication establishment.

DB attributes (to describe something)
↓

the more attributes the better information

Person → Name, age, address, phone no.
(entity) (attribute)

Types of attributes

- i) Simple and composite attribute

↓ ↓

can't be can be divided

divided further further (composed of many attributes)

Name
↓ ↓ ↓
F. Name M. Name Last Name

NULL - the value doesn't exist or not applicable.
eg - Middle name

Date _____

2) Single valued vs multivalued attribute

Only one
value

eg - age.

More than

one value.

eg - address

(permanent or
residential address)

3) Stored vs derived attributes

We store
these values

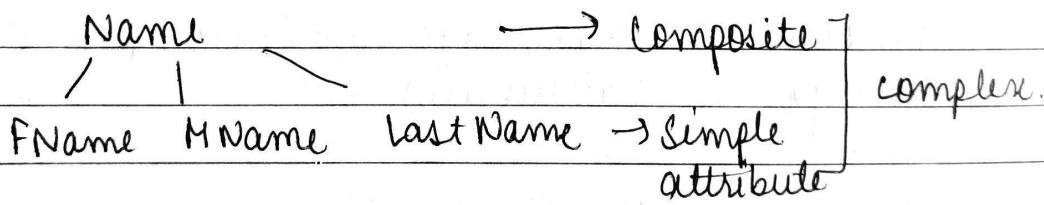

depending on the data
we derive

eg - DOB.

eg - Age (deriving from DOB)

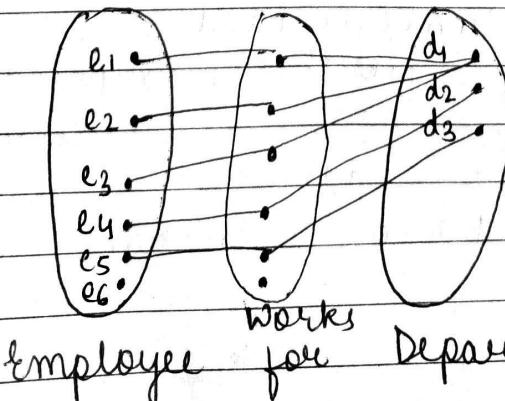

4) Complex attributes

Collectn of attributes or combn of attributes.

DB Relationships

1 to Many

Requirement Analysis
Every employee
works for a dep
and a dep can
have many emp.
New dep need not
have any emp.

Degree - (how many entity set is participating)

~~Structural constraints~~
Degree - 2 (Employee, department)

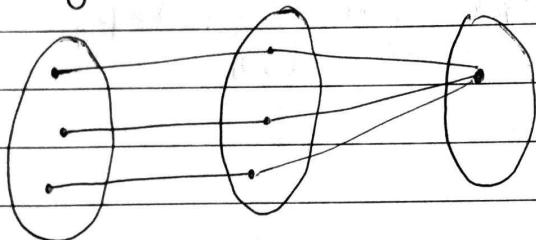

Cardinality Ratio - what is the max^m no of relationships in which an entity can participate.

Cardinality 1

Employee

N

Department

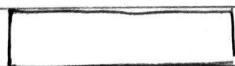

Participation or existence (min^m cardinality)

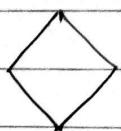

Min^m relationship in which it can participate.

In case of Employee participation is 1.

New dep need not have any employee. Therefore participation is 0 in this case of dep.

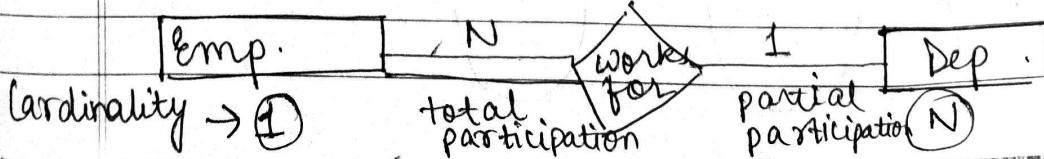

Entity

Relationship

1 dep. can have many emp.

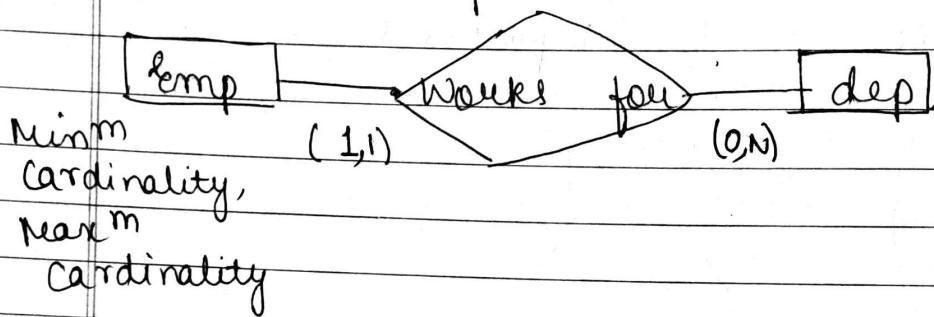

total participation
All entities are participating

partial participation
If some entities are participating

cardinality double line ratio

Min^m max representation

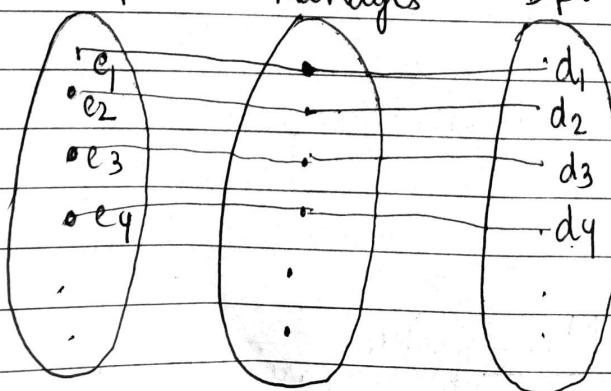

Min^m-max^m relation or representation
elaborates more information

Role name Employee

Employer

role name DB relationship
(one to one)
(Employee, manager) Emp. manages Dept

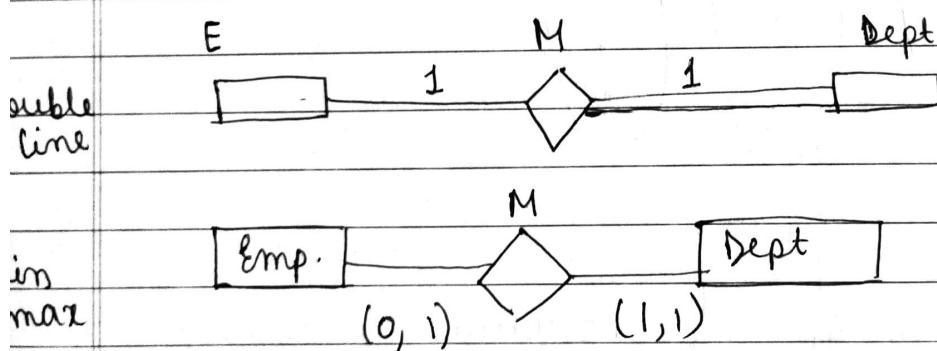

Every Dept. should have a manager and only one employee manages a dept.

Any employee can manage only one department

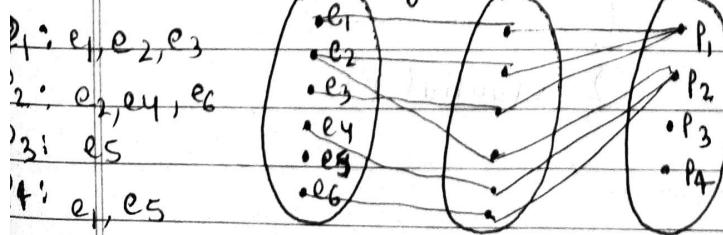

Degree \rightarrow 2

Cardinality $\rightarrow \begin{cases} 1 & (\text{max}^m \text{ no of relationship one entity can manage}) \\ 1 & \end{cases}$

Participation \rightarrow Employee (P) 0 (min^m no of relⁿ)
Dept. (T) 1 (every dept should have a manager)

DB Relationship (Many to many)
Employee works Project

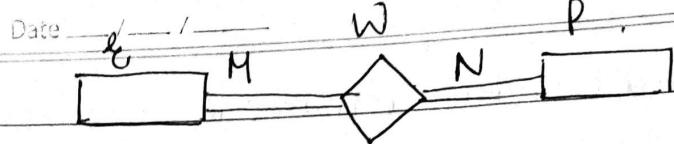

Degree 2

Cardinality N

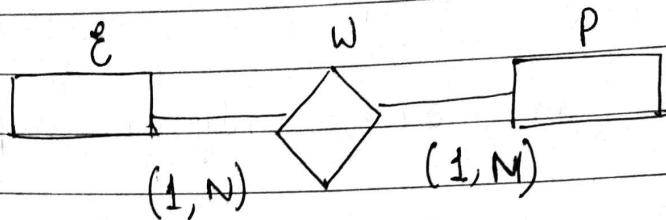

Participation 1

Req. Analysis - Every employee can work on atleast project & an employee can work on many projects

Single L-
Double
line

Min-max
reprⁿ

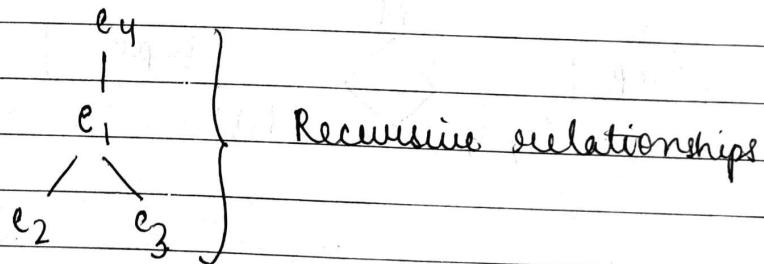

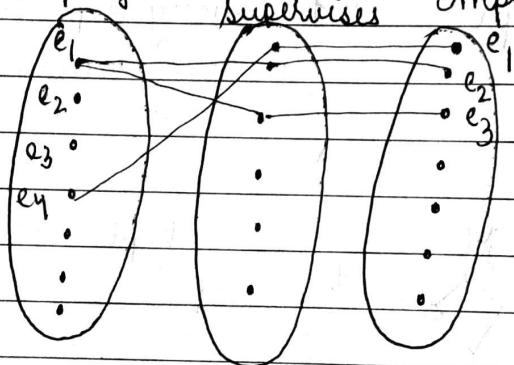

DB recursive relationships

Even though its recursive its binary (2 entities only)

An employee managing other employee
(Boss) (Secretary)

as → acts as.

Employee (a S, supervisor) supervises Employee (a S, supervised)

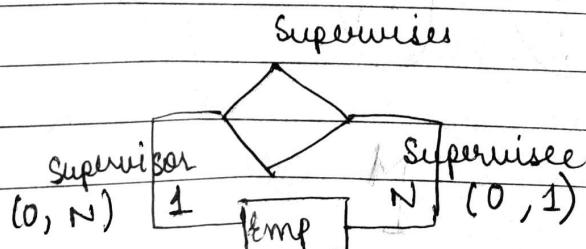

Degree : 2 entities

Cardinality : N

1

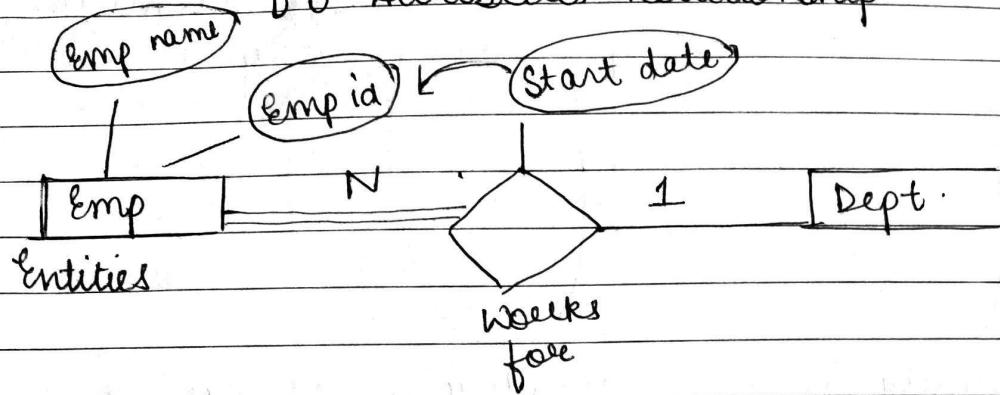

Participation : O

O (Partial P)

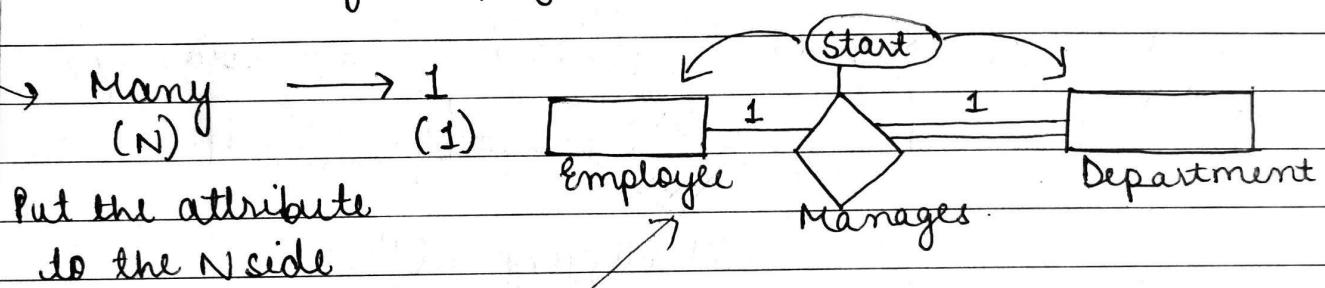

DB Attributes Relationship

We want to have as less as attribute to the relationship

So it's better to give the attribute at the n side or many side as every employee can have a start date.

$1 \rightarrow 1$

Any side we can move the attribute

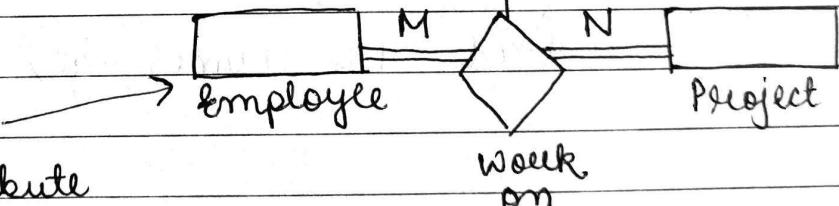

$M \rightarrow N$

Putting the attribute at any side is not feasible.

DB weak entity

hours

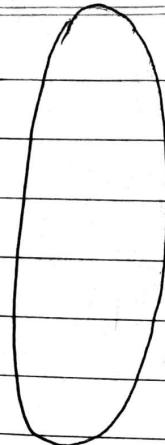

week on

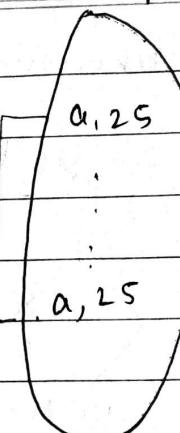

Date _____ / Employee. -(Emp Id) dependents

strong entity

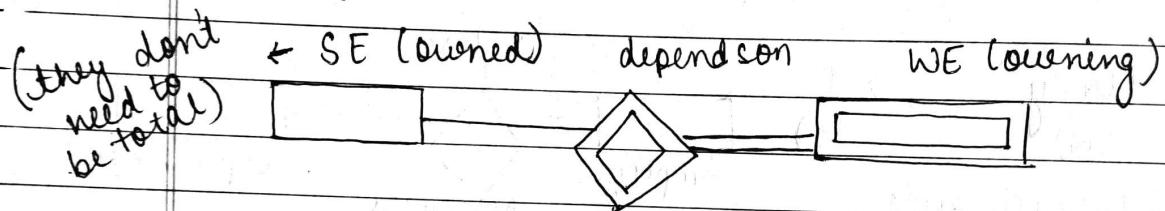

weak entity Identifying relatⁿ.

if entity is having primary key

if entity is not having primary key.

Solⁿ: Every weak entity should be related to strong entity.

Identifying relⁿ.

* The participation should always be total in identifying relⁿ of weak entity.

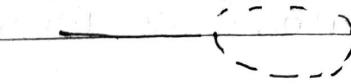

(fid + Name, age)

Total participation $\not\Rightarrow$ Weak entity
Weak entity \Rightarrow Total participation

DB ER diagram notations

Derived attribute

attribute

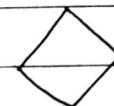

entity

Weak entity

Relationship

identifying relⁿ

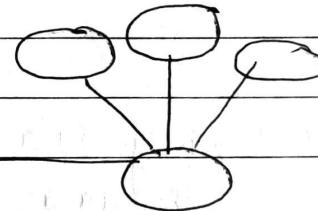

key attribute

multivalued
attribute

Composite
attribute

Total participation
of E₂ in R

Cardinality ratio
 $E_1 : E_2 = 1 : N$

(RDBMS) SQL - SEQUEL - Structured English query language
↓
Simple

Date _____ / _____

Relational Database Model

DB Introduction to relational model.

Conceptual level → ER diagrams

(Database model) Representation level → Relational model

Physical level

Relational Algebra

RDB + RA + RC → Relational calculus.

↓
RDBMS

↓
SQL

→ Formal language

(SQL)

→ RDBMS

Relational → RDB.
DB.

1960s - 1970s (IBM)

Legacy Systems (DBMS)

Hierarchical Network (DB)

DB model

Data warehouse → huge data
Databases. → less data

Set theory → relations → relational DB models.

SQL runs on RDBMS.

Query → converted to relational algebra.

DB - Terminology of Relational database

1) Relation (table)

2) Tuple (row) → An entire entity

3) Attribute (column)

attribute →

4) Domain set of names/values eg - set of integers
It is finite for assumption

int

1		

5) Relation schema (heading of the table)

attributes R(A₁, A₂, A₃, A₄, A₅) R

Domains D₁ D₂ D₃ D₄ D₅.

A ₁	A ₂	A ₃	A ₄	A ₅

$\delta(R) = D_1 \times D_2 \times D_3 \times D_4 \times D_5$ = an ordered pair containing all values from

The relation is a subset of cartesian product.

$$\gamma(R) \subseteq D_1 \times D_2 \times D_3 \times D_4 \times D_5.$$

Cardinality: $|D_1|$

- 6) current relation state - The no of elements present in the table at current state.
- 7) degree of relation \rightarrow The no. of attributes in table.
- 8) intension \rightarrow relation schema (heading)
- 9) extension \rightarrow table itself

DB tuples, tuple values
& Null

Relational model - A relation is a set so ordering is something we give.

No 2-tuples would have same value.
No duplicates are allowed.

Exceptions

No value

Eg: phone no.

Not applicable

Eg: Middle name

Null values

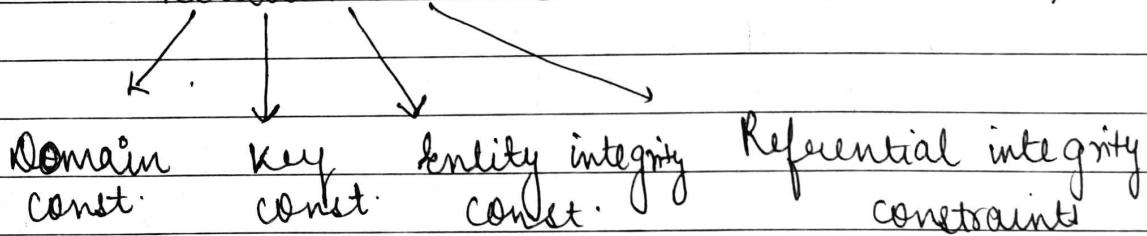

DB constraints on Relational DB Schema.

Domain constraints

In the design level we could put up some restriction on data.

Eg: The value should be etc.

Relational constraints (Restrictions)

Domain constraints

SNo	FNO	MNa	LNa	Name
				→ Not allowed every value should be atomic not divisible.

Relation - Flat file

No composite or multivalue attributes are allowed into the domain? You can break it into another table.

Entire schema should be atomic

Key constraints

No 2 tuples should have the same values.

$t_1 \rightarrow$			
$t_2 \rightarrow$			

$t_1 \neq t_2$.

Some attributes can have the same value but not all the tuples.

S No	SName	marks.	\rightarrow Superkey
1	Ravi	100	
2	Sakshi	50	
3	Ritu	40	

Superkey \rightarrow A subset of attributes which uniquely identifies a table.

Even after deleting SName or marks we can uniquely identify a table.

Key - minimal superkey is a key.

If in the worst set of all the attributes in a superkey is called a key.

* Any superset of a key is a superkey.

(SNo + SName)
 ↓ ↓
 Key Super
 Key

SK \rightarrow all the attributes
 Key \rightarrow minimize the SK

Key \rightarrow A₁

Attributes \rightarrow A₁, A₂, A₃, A₄

$$2 \times 2 \times 2 \times 2 = 8 = 2^3$$

minimal - del till no keys are present

Date _____

How many keys can be there for a relation?
More than one key.

For ex.

Candidate keys

RN + EN

ON	color	Price	RN	EN

Candidate keys - If we have more than one minimal superkey for a table then it is called a candidate key.

Primary key - One of the key in candidate key which uniquely identifies a table.

$A_1, A_2, A_3, A_4 \rightarrow$ Superkey (No 2 tuples can have the same value)

$(A_2, A_4, A_3) \rightarrow SK$

$(A_3, A_4) \rightarrow SK$. and key (minimal superkey)

$A_1, A_2, A_3, A_4 \rightarrow SK$

$(A_1, A_2, A_4) \rightarrow SK$ and key primary key

Candidate key = $((A_3, A_4), (A_1, A_2, A_4))$. choose candidate key with less no of attrb.

DB Entity and referential integrity constraint

1) Entity integrity

Referential integrity

ENO |

b

There should be any null value.

→ No attribute should have a null value.

2) Referential integrity (Btw^n. 2 or more tables)

Employee FK → Department

ENO	ENa	Dept No	Dept No
1	a	1	1
2	a	x	2

If he → newly joined

Referencing

Referred or base

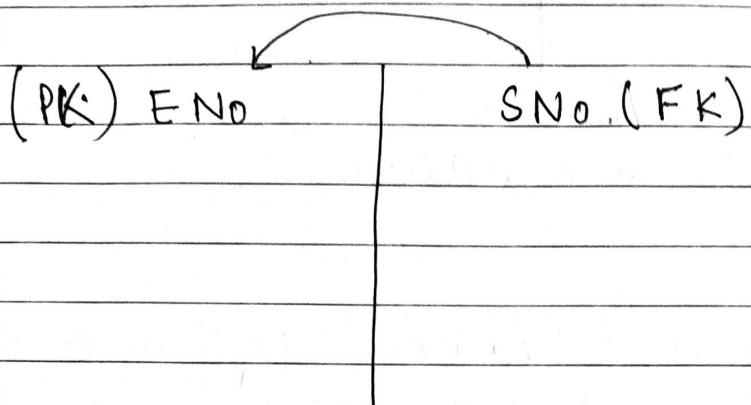

Foreign key → Primary key on another table.

1) Null values are allowed.

2) We can have more than one foreign key

In case of recursive relationships referential integrity exists in the same table.

Primary key

i) A key which uniquely identifies tuples in a table.

2) Null values not allowed

3) Only one primary key exists

Foreign key

i) Primary key on another table is called foreign key for the given table.

2) Null values allowed

3) More than one foreign key can be there

DB Action upon constraints violations.

When we modify (insertion, updation & deletion) constraints are violated:

i) Insertion

Ename	Eno	Dep.	Supervisor

Domain constraint → violated

key constraint → violated (duplicate values)

Entity " → null values can be inserted

Referential constraint → value ^{not} present can't be some value. violated

Can be performed	Domain	key	entity	Referential
Insertion	x	x	x	x

Updation	✓	✓	✓	x
----------	---	---	---	---

Deletion	✓	✓	✓	x 1) (Reject) 2) (Cascade)
----------	---	---	---	----------------------------------

Delete the tuple & the entire tuple from other table

3) (Set Null)

or some other value

Counting the number of possible key

1) $R(A_1, A_2, A_3 \dots A_n)$

$CK = \{A_1\}$. (smallest superkey possible)

Superset of

CK is a

SK.

A_1	A_2
1	a
2	a
3	b
4	b

2 2
1 1

$R(A_1, A_2, A_3)$

X
 $CK = \{A_1\}$

$SK = A_1, (A_1 A_2), (A_1 A_3), (A_1 A_2 A_3)$

$R(\underline{A_1}, \underbrace{A_2, A_3 \dots A_n})$

$SK = 2^{n-1}$

$n-2$.

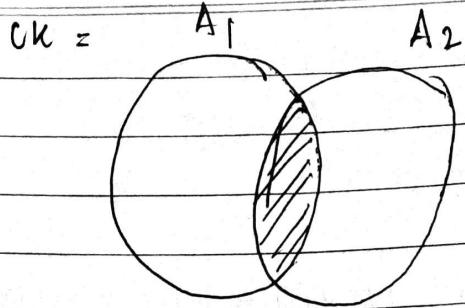

2) $R(A_1, A_2, A_3 \dots \overbrace{A_n})$

$CK = \{A_1, A_2\}$

$CK = \{A_1, A_2\} 2^{n-2}$

$CK = \{A_1, A_2 A_3\} = 2^{n-3}$.

$CK = \{A_1, A_2\}$

$$SK = SK(A_1) + SK(A_2) - SK(A_1 A_2)$$

$$= 2^{n-1} + 2^{n-1} - 2^{n-2}$$

$$= 2 \times 2^{n-1} - 2^{n-2}$$

3) $R(A_1, A_2, A_3 \dots A_n)$

$$CK = \{A_1, A_2 A_3\}$$

$$SK(A_1) + SK(A_2 A_3) - SK(A_1 A_2 A_3)$$

$$2^{n-1} + 2^{n-2} - 2^{n-3}$$

$$CK = \{A_1, A_1 A_2\} \rightarrow \text{not possible}$$

\downarrow

(SK)

$$CK = \{A_1, A_2, A_3 A_4\}$$

$$SK(A_1 A_2) + SK(A_3 A_4) - SK(A_1 A_2 A_3 A_4)$$

$$= 2^{n-2} + 2^{n-2} - 2^{n-4}$$

4) $R(A_1 A_2 \dots A_n)$

$C_K = \{A_1 A_2, A_1 A_3\}$. → these is possible because they are not the superset of each other.

$$SK(A_1 A_2) + SK(A_1 A_3) \\ - SK(A_1 A_2 A_3)$$

$$2^{n-2} + 2^{n-2} - 2^{n-3}.$$

5) $R(A_1 A_2 \dots A_n)$

$$C_K = \{A_1, A_2, A_3\}.$$

$$SK(A_1) + SK(A_2) + SK(A_3) - SK(A_1 A_2) - SK(A_2 A_3) \\ - SK(A_1 A_3) \\ + SK(A_1 A_2 A_3)$$

$$2^{n-1} + 2^{n-1} + 2^{n-1} - 2^{n-2} - 2^{n-2} - 2^{n-2} + 2^{n-3}.$$

6) $R(A B C D)$

$$C_K(A, BC)$$

find SK ?

$$SK(A) + SK(BC) - S(ABC)$$

$$= 2^{n-1} + 2^{n-2} - 2^{n-3}.$$

$$n=4$$

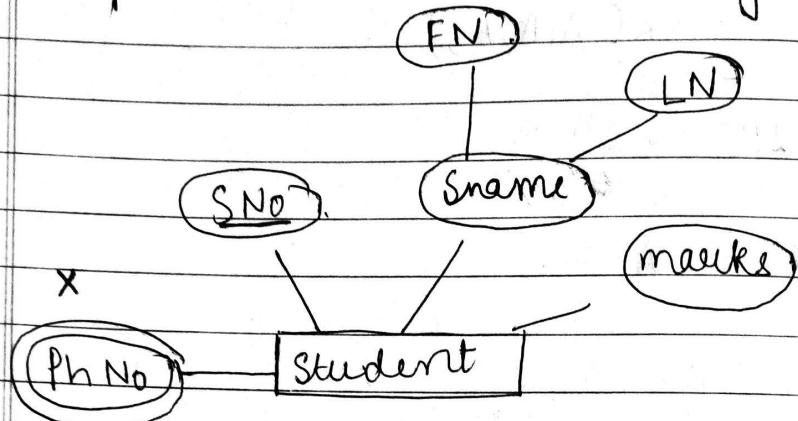

$$= 2^{4-1} + 2^{4-2} - 2^{4-3}$$

$$= 6 + 4 - 2.$$

$$= 10 \text{ Keys}$$

Module 3 : Conversion of ER model to Relational model

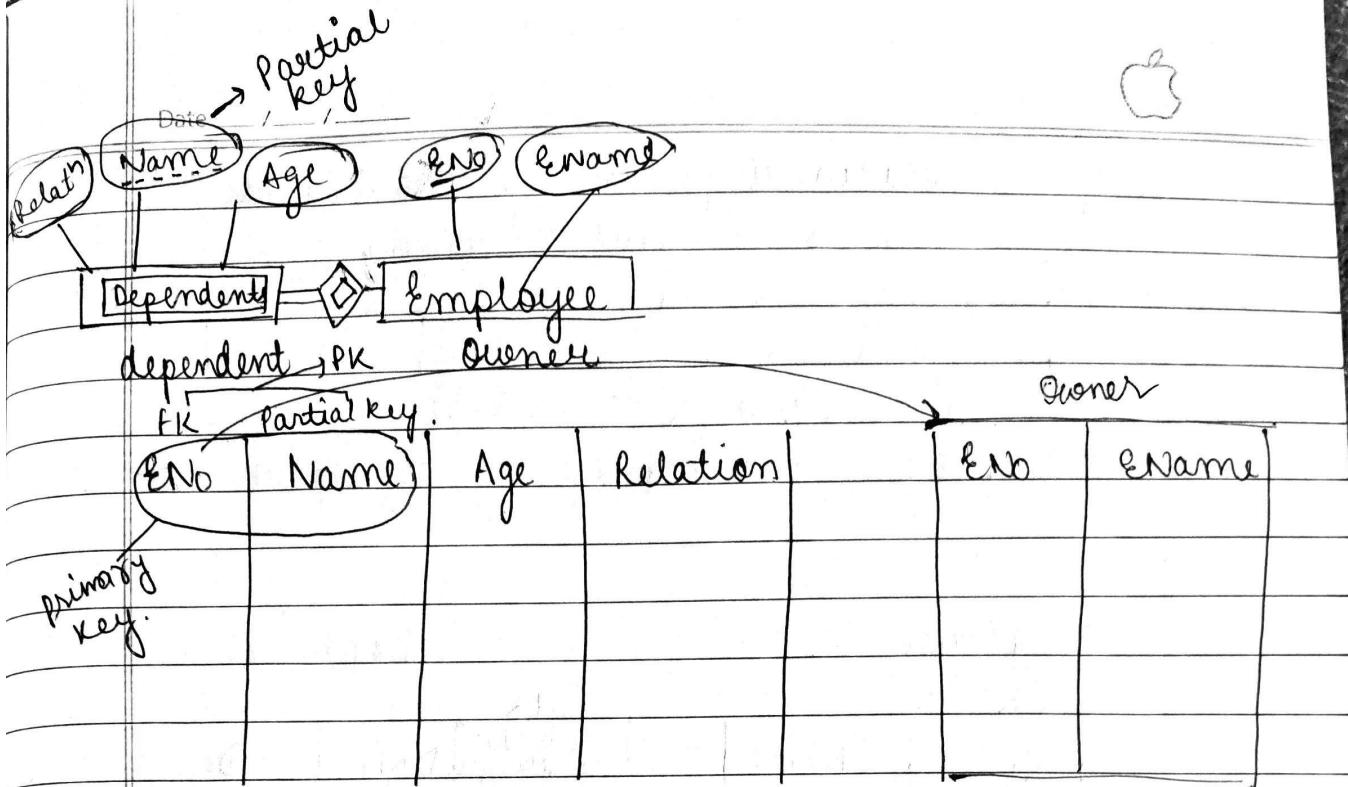

Step 1: Convert the entity into relations

ignore the
multivalue
attribute

- a) Add the simple attribute
 - b) for composite add the simple attribute in the table
 - c) Don't add the multivalue attribute

Step 2:

Once you create the relation add all the primary key of owner entity to dependent with full contribution.

Partial key - You will not identify the tuple uniquely but can use for part of a table.

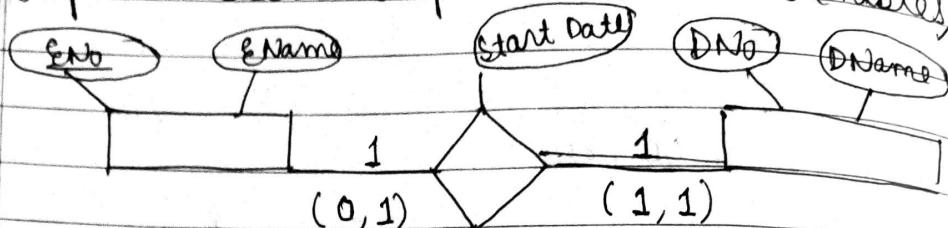

Need not to take care of the identifying relⁿ.

Foreign key → weak entity + identifying.

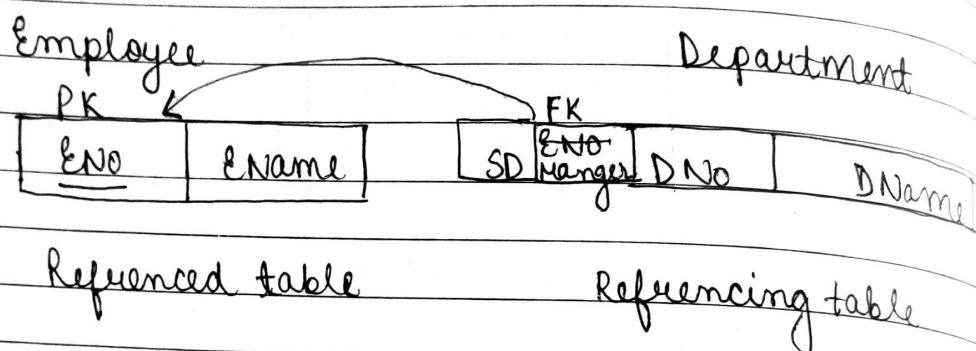

On del or update on the owner side there should be cascading (i.e. del on both the sides) for weak entity.

Date _____ / _____ / _____

Step 3: Relationships to relations (tables)

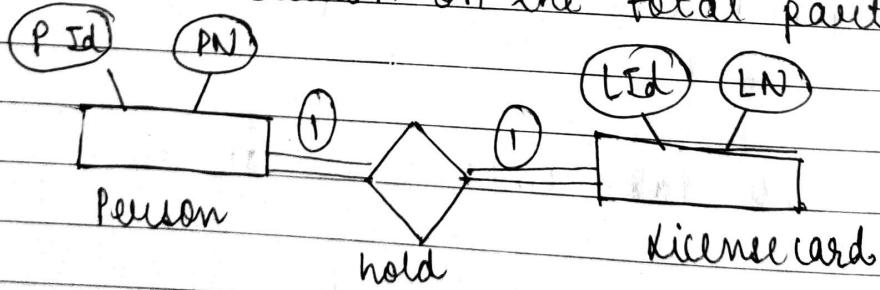

Employee manages Department

Take the PK on either side of the total partip
side and include it on this side as PK.
Do the same in

* Do the inclusion on the total participating s

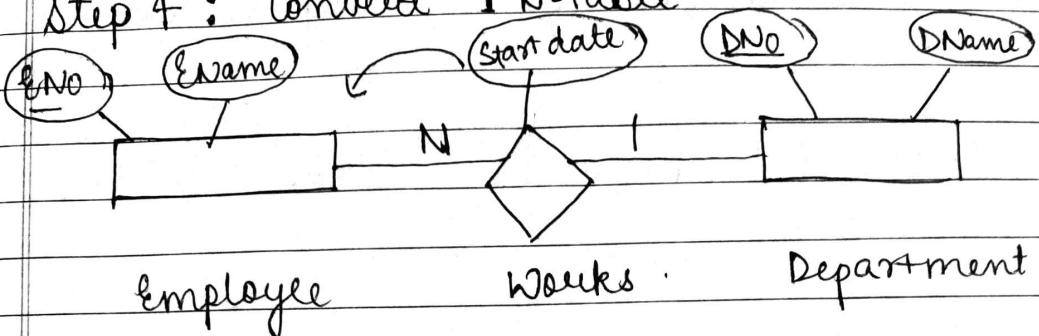

no of entities (person) = no of license card (entity)

Combine both the table.

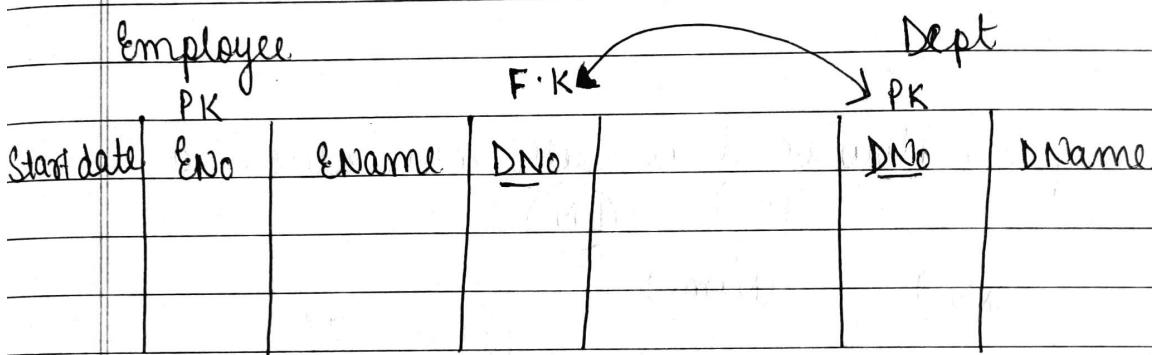

Person		license card	
Pid	PN	Lid	LN

Step 4 : Convert 1 N-table

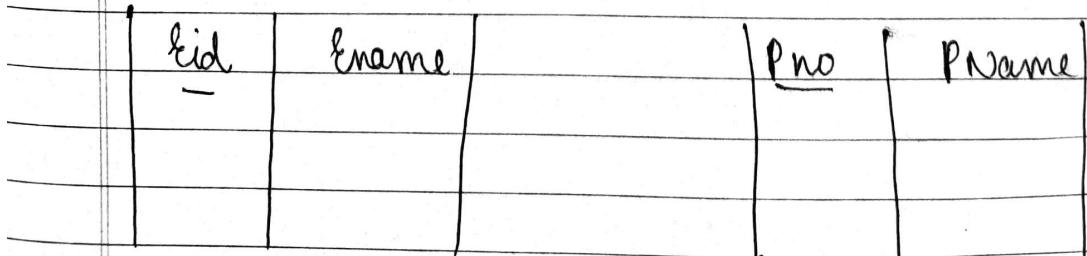

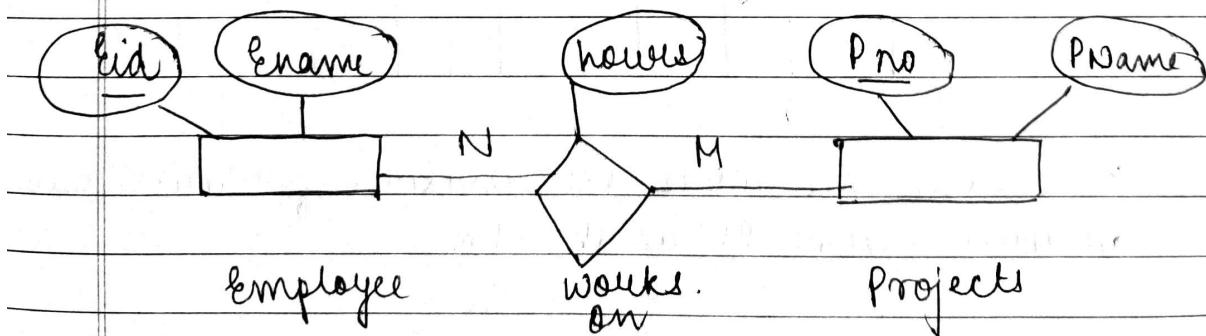

A Dept. can have many employees.

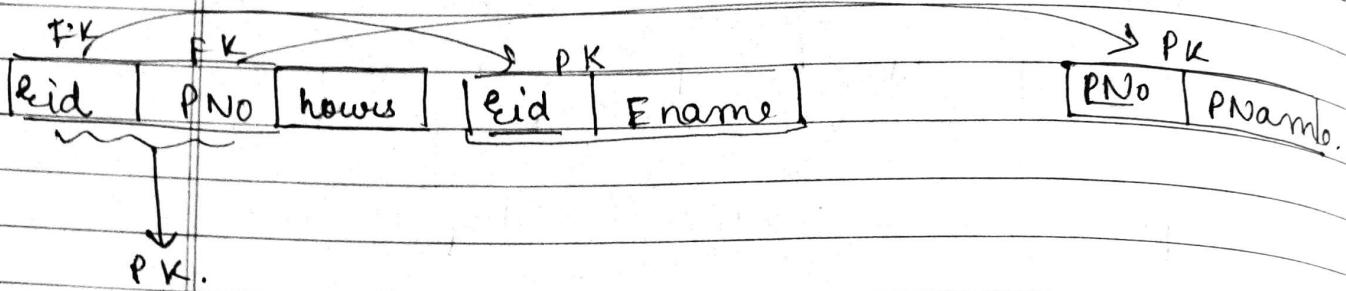

Add the attribute on the one side.

Step 5: Convert Many Many to table

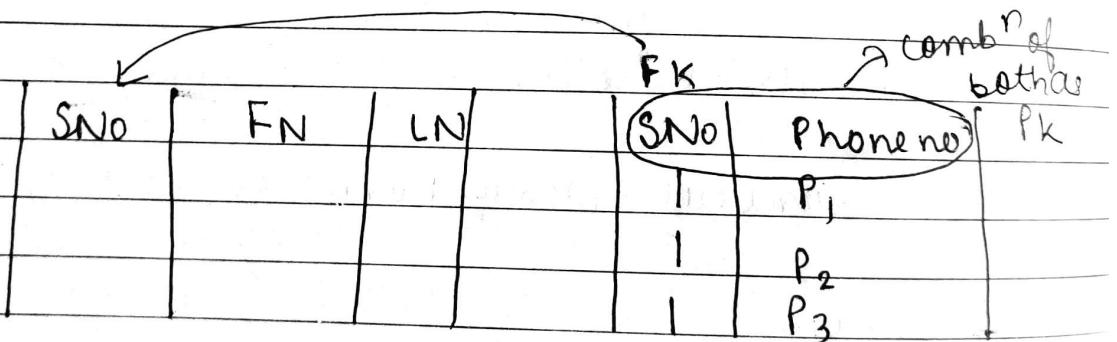

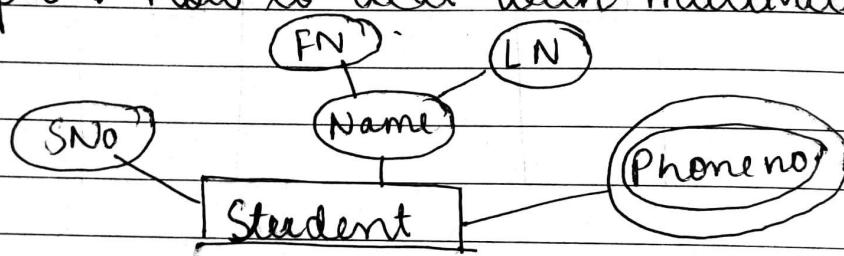

We can't use the foreign key on diffn. tabs.

In case of M to N create a new table.

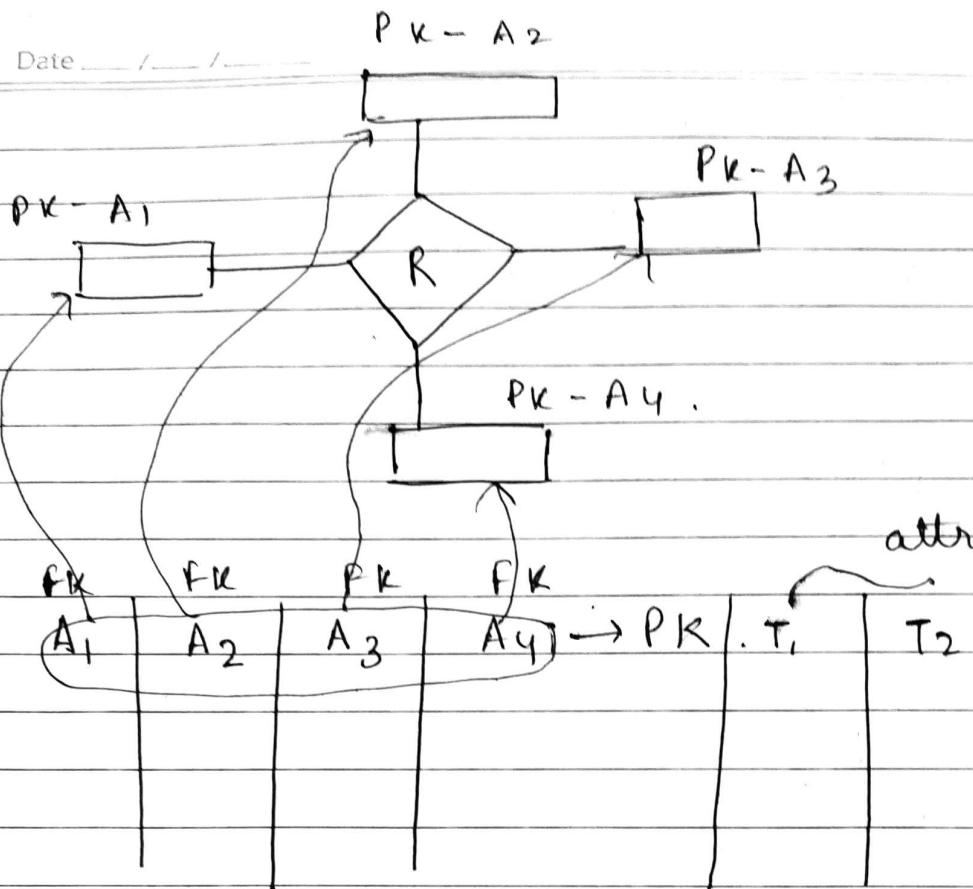

1 - 1

Step 6 : How to deal with multivalued attribute

We create one more new relation for multivalue attribute with PK as the FK.

Step 7 :

ER model

Entity type

1:1 or 1:N

M:N

Nary relationship type

Simple attribute

Composite "

multivalued "

value set

key attribute

Relational model

entity relation

foreign key (or relⁿ)

relationship (relⁿ) + 2 F K's.

relationship (relⁿ) + n F K's.

Attribute

Set of simple component

Relation and Foreign key

Domain

Primary key

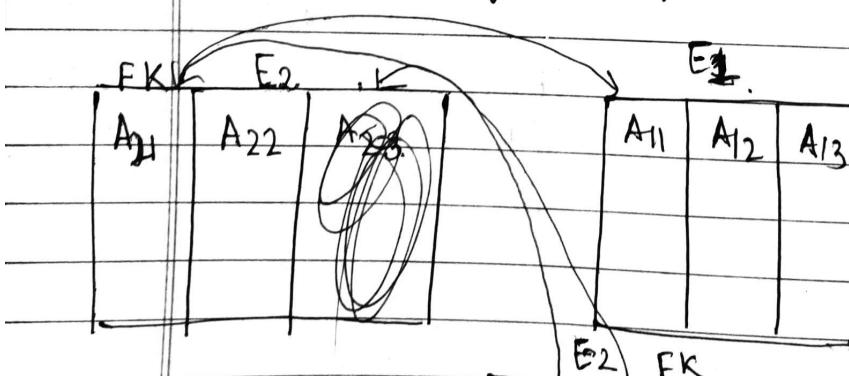

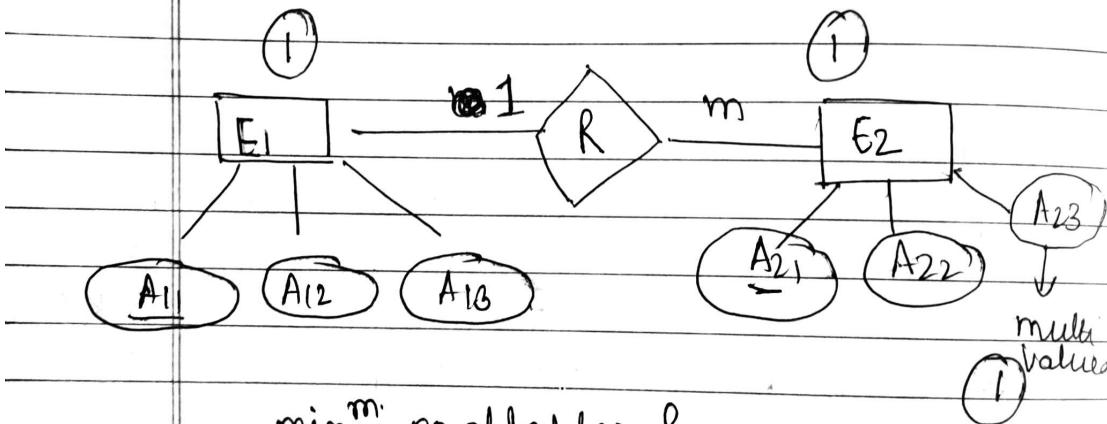

Questions

Rent & payment should be added as an attribute to

- a) none
- b) Hotel
- c) Person
- d) Lodging

3 tables

A21	A23	

A	C
2 x	4 x
3	4
4	3
5 x	2 x
7 x	2 x
9 x	5 x
6	4

2	4
3	3
4	2
5	2
6	5
7	1
8	1
9	4

6. Which tuples should be deleted when (2, 4) is deleted.

(5, 2) (7, 2) & (9, 5)

Q. E₁, E₂ → 2 entities

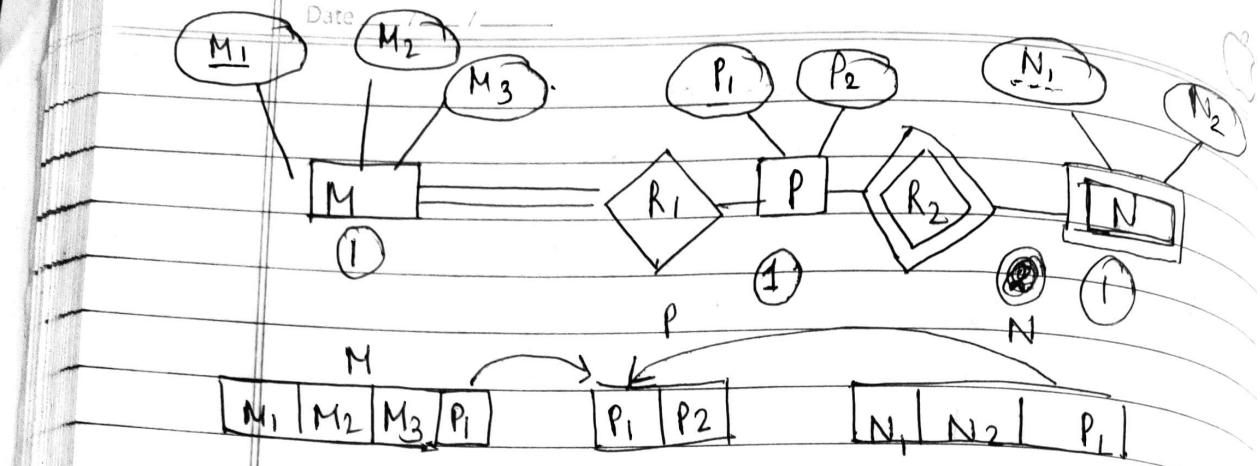

R₁, R₂ → 2 relations

Here we need a table for E₁, one for E₂

R₁ is represented as FK in E₂

for R₂ we need one table have PKE₁ & PKE₂.

3 tables

- Q. Let $R(a, b, c)$ and $S(d, e, f)$ be 2 rel's. 'd' is foreign key of S that refers to the primary key of R .

'R' & 'S'

R		S		
(PK) a	b	c	(FK) d	e
				f

which can cause violation of referential integrity

Insert into S ^{might} cause
Delete from R

Normalisation

Introduction

Procedure of dividing the table into small tables.

fid	EN	Did	Did	Dname
1	a	1	1	CS.

Putting everything we have in one big (universal) table:

i) Redundancy is possible

fid	Did	DN
1	1	CS
2	1	CS
3.	1	CS.

2) anomalies (problems)

i) Insert (same information at many places leads to inconsistency)

2) Deletion

3) Updation or modification

To the solⁿ. take every table and do splitting of tables called normalisation.

Introduction to Functional dependencies

A	B	C
1		
(2)	a	b
3		
4		
(2)	a	b

$$A \rightarrow BC$$

If we knew value of A then we can find values of B & C.

$$t_1(A) = t_2(A)$$

then

$$t_1(BC) = t_2(BC)$$

A	B	
a	1	$A \rightarrow B$.
a	1	A determines B.

Various usage of FD

- i) identifying the add'l FD
- ii) identify the keys
- iii) identifying equivalences of FD
- iv) finding minimal FD set

Two methods

inference
rules

closure set
of attributes

reflexive: $A \rightarrow B$ if $B \subseteq A$

$A \rightarrow B \wedge B \rightarrow C$

transitive: then $\bullet A \rightarrow C$

Decomposition: $A \rightarrow BC$ then

$A \rightarrow B$ and $A \rightarrow C$.

Augmentation: $A \rightarrow B$ then

$A C \rightarrow BC$.

Union

If $A \rightarrow B$ and $A \rightarrow C$ then
 $A \rightarrow BC$

Composition.

If $A \rightarrow B$ and $C \rightarrow D$
then $AC \rightarrow BD$

Closure set of rules.

Set of attributes that can be functionally determined from it.

FD: $A \rightarrow B$ $B \rightarrow D$ $C \rightarrow DE$ $CD \rightarrow AB$.

$$A^+ = \{B, D, A\}$$

In the table having attributes A, B, D

$$A^+ = \{B, D, A\}$$

$$B^+ = \{D, B\}.$$

$$C^+ = \{D, E, C, A, B\} \rightarrow$$

$$D^+ = \{D\}$$

$$E^+ = \{E\}.$$

$$(CD)^+ = \{C, D, E, A, B\}.$$

$$(AD)^+ = \{A, D, B\} \rightarrow$$

$$A \rightarrow B$$

$$B \rightarrow D$$

$$C \rightarrow DE$$

$$CD \rightarrow AB.$$

$$AB \rightarrow CD$$

$$AF \rightarrow D$$

$$DE \rightarrow F$$

$$C \rightarrow G_1$$

$$F \rightarrow E$$

$$G_1 \rightarrow A$$

$$(CF)^+ = \{ C, F, D, E \} \\ G_1, A$$

$$(BG_1)^+ = \{ B, G_1, D, A, E \}$$

$$(AF)^+ = \{ A, F, B, E, D, C, G_1 \} \quad \{ A, F, D, E \}$$

$$(AB)^+ = \{ A, B, D, C, G_1 \}$$

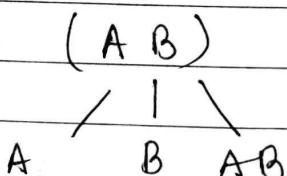

Determining the candidate key
 $R(ABCD)$

$$A \rightarrow B$$

$$B \rightarrow C$$

$$C \rightarrow D$$

$$D \rightarrow A$$

$$(A \ B \ C)$$

$$A, B, C, AB, BC, CA, ABC$$

(A_1, A_2, \dots, A_n)

Candidate key = 2^{n-1} candidate key

$$R(A B C D) \rightarrow 2^{4-1} = 15$$

If no candidate key exists then set of all attributes is candidate key.

ABCD. ①

BCD, ABC, ACD, ABD. ④
 AB, BC, CD, DA, AC, BD ⑥
 A, B, C, D ④

$$A \rightarrow B$$

$$B \rightarrow C$$

$$C \rightarrow D$$

$$D \rightarrow A$$

$$A^+ = \{A, B, C, D\} \quad A \text{ is a candidate key}$$

$$B^+ = \{B, C, D, A\}$$

$$C^+ = \{A, B, C, D\}$$

$$D^+ = \{A, B, C, D\}$$

$$R = (A, B, C, D, E, F)$$

FDS: $C \rightarrow F$ $E \rightarrow A$ $E \rightarrow D$ $A \rightarrow B$ Key = ?

$$CD^+ = \{C, D, F\} \quad (CE)^+ = (\overbrace{AB}^{\sim}, \overbrace{CDEF}^{\sim})$$

key \nwarrow $ECT^+ = \{E, C, D, A, F, B\}$.

$$AE^+ = \{A, E, B\}$$

$$AC^+ = \{A, B, C, F\}$$

$R = \{E, F, G, H, I, J, K, L, M, N\}$

FD: $\begin{cases} \{E, F\} \rightarrow \{G\} \\ \{F\} \rightarrow \{I, J\} \end{cases}$

$\{K\} \rightarrow \{M\}$

$\{E, H\} \rightarrow \{K, L\}$

$\{K\} \rightarrow \{M\}$

$\{L\} \rightarrow \{N\}$

$EF \rightarrow G$

$F \rightarrow IJ$

$K \rightarrow M$

$EH \rightarrow KL$

$K \rightarrow M$

$L \rightarrow N$.

$(EFH)^+ = (E \textcircled{F} G \textcircled{H})^+ IJKLMN$

2⁺ Super Key.

1 candidate key

$R = \{A, B, C, D, E, M\}$

FD:

$A \rightarrow B$ $E \rightarrow C$
 $B \leftarrow C \rightarrow D$ $D \rightarrow A$

$$(EH)^+ = (\overbrace{AB}^U \overbrace{CD}^V \overbrace{EH}^W)$$

d) AEH, BEH, DEH

$$(EH)^+ = \{C, E, H\}$$

No of SK =

$$B - (AEH)^+ = \{A, E, H, C, B, D\} \cup (ck)$$

$$B - (BEH)^+ = \{B, E, H, C, D, A\} \cup (ck)$$

$$(CEH)^+ = \{C, E, H\} \times$$

$$A^+ = \{ A, B, C \} -$$

$$B^+ = \{ B, A, C \} -$$

$$C^+ = \{ C, A, B \} -$$

Equivalent.

DB - Minimal cover.

Procedure to find minimal set

- 1) Split the FDs such that RHS contain single attribute.

$$A \rightarrow BC \Rightarrow A \rightarrow B \text{ and } A \rightarrow C$$

- 2) Find the redundant FDs and delete them from the set

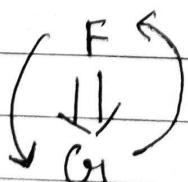

Ex : $\{A \rightarrow B, B \rightarrow C, A \rightarrow C\}$ If closure of
 $\Rightarrow \{A \rightarrow B, B \rightarrow C\}$. $B \rightarrow D$ $B^+ = \{D\}$ del.

- 3) Find the redundant attributes on LHS and delete them.

Ex: $A B \rightarrow C$ $A \rightarrow$ can be deleted if
 B^+ contains 'A'.

Minimize

$$\{A \rightarrow C, AC \rightarrow D, E \rightarrow AD, E \rightarrow H\}$$

minimal - you can't del further

- | | |
|--------------------|--------------------|
| $A \rightarrow C$ | $A \rightarrow C$ |
| $AC \rightarrow D$ | $AC \rightarrow D$ |
| $E \rightarrow AD$ | $E \rightarrow A$ |
| $E \rightarrow H$ | $E \rightarrow D$ |
| | $E \rightarrow H$ |

Date / /

$$2) A^+ = \{A\}$$

$$AC^+ = \{A, C\}$$

$$E^+ = \{D, E, H\}.$$

$$A \rightarrow C$$

$$AC \rightarrow D$$

$$E \rightarrow D \quad E^+ = \{A, H, E\}, \quad C, D \quad \checkmark$$

$$E \rightarrow A$$

$$E \rightarrow D, X$$

$$E \rightarrow H$$

$$E \rightarrow H \quad E^+ = \{A, C, E, \text{ } \checkmark\}.$$

D

$$A \rightarrow C \quad A^+ = \{A\}$$

2) Delete $E \rightarrow D$

$$AC \rightarrow D \quad AC^+ = \{A, C\}$$

$$E \rightarrow A \quad E^+ = \{D, H, E\} \quad \checkmark$$

3) On the LHS

$$E \rightarrow D \quad E^+ = \{A, H, C, D, E\} \quad \checkmark$$

$$E \rightarrow H \quad E^+ = \{A, D, C, E\}$$

$$C^+ = \{C\} \quad A^+ = \{A, C\}.$$

$$A \rightarrow C$$

$$E \rightarrow A$$

$$E \rightarrow H$$

$$\boxed{AC \rightarrow D}$$

$$A^+ = \{C, A\}.$$

$$C^+ = \{C\}$$

So we will delete 'C'

$$A \rightarrow C$$

$$A \rightarrow CD$$

$$A \rightarrow D$$

$$E \rightarrow AH$$

$$E \rightarrow A$$

~~$$A \rightarrow CD$$~~

$$E \rightarrow H$$

Lossless decomposition

 \end{array}$$

$D \rightarrow A$
It is not preserving $B C \rightarrow B C \times$

Q. R (A B C D E G)

F: A B → C, A C → B, A D → E,
B → D, B C → A, E → G.

D: (ABC, ABDE, EG)

- 1) First see all the attributes are present on the decomposed table or not.

Attribute = A B C D E G ✓ } Getting the
D = A B C D E G ✓ original table

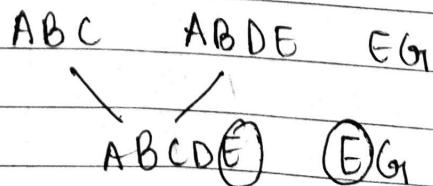

- 2) Lossless → find the candidate key.

(ABC), (AB) DE, EG

If AB^+ contains C or DE it's the PK for the table.

$$AB^+ = \{A, B, D, E, G, C\}$$

AB can be the candidate key if one of them

$$E^+ = \{E, G_1\}$$

E can be the candidate key for one of the table.

\therefore It is lossless decomposition.

3) Function preserving

Only non-trivial dependencies should be taken into account.

	A B C	A B D E	E G ₁
rivial	$A \rightarrow A$ $B \rightarrow D$ $C \rightarrow C$	$A \rightarrow A$ $B \rightarrow D$ $E \rightarrow G_1$ $AB \rightarrow DE$ $AD \rightarrow$	G_1
	$\downarrow \rightarrow$ no dependencies found		
	$AC^+ = \{AC, B, D\}$ $BC^+ = \{BC, DA\}$ $A^+ = \{A\}$ $B^+ = \{B, D\}$ $C^+ = \{C\}$ $AB^+ = \{ABC, DEG_1\}$		
		$AD^+ = \{ADE, G_1\}$	
	$AB \rightarrow C$		
	$BC \rightarrow A$		
	$AC \rightarrow B$		
2 \rightarrow 3 dependencies			

DB IN Form. (all the attribute should be atomic)

- 1) We will go for normalisation in order to remove redundancy
- 2) In INF attribute values in a table should be atomic, i.e neither multivalued attributes nor composite attributes is allowed.
- 3) Every table is in INF since the formal definition of a reln. guarantee that the attribute values should be atomic (not division).

Multivalued

Approach 1			Approach 2		
ENo	Ename	Phone	ENo	Ename	Phone
1	a	1234	1	a	1234
		5678	2	b	1212
2	b	1212	2	b	1342
		1842			

Redundant data

	ENo	Ename	ENo	Phone
	1	a	1	1234
	2	b	1	5678
			2	1212
			2	1342

Composite attribute

E _{No}	E _{name}		E _{No}	F _{N₁}	F _{N₂}
	F _{N₁}	F _{N₂}			
			⇒		

nested attributes → composite + multivalued.

To reduce redundancy → normalisation

DB - Second normal form

- 1) In 2NF, we don't allow any partial dependencies.
- 2) A relation schema R is in 2NF, if every non prime attribute "A" in R is not partially dependent on any key of R.
- 3) A functional dependency $X \rightarrow Y$ is a partial dependency, if some attribute "A" $\in X$ can be removed from X and the dependency still holds.

A	B	C	$AB \rightarrow C$	$AB^+ = ABC$	ABC
a ₁	b ₁	c ₁	partial dependency redundancy $B \rightarrow C$	Key = AB. $NK = C$	AB^+ BC $a_1 b_1$ $a_2 b_2$ $a_3 b_3$ $a_4 b_3$ $a_5 b_3$ $a_6 b_3$
a ₂	b ₂	c ₂			
a ₃	b ₃	c ₃			
a ₄	b ₃	c ₃			
a ₅	b ₃	c ₃			
a ₆	b ₃	c ₃			

Third normal form

Even after making the table in 2NF it contains some dependencies or redundancies which need to be removed.

No non key attribute should define other non key attribute.

It is preventing as well as ~~lossless~~ decom.

Date / /

A	B	C	$A \rightarrow B$	$A^+ = ABC$

3NF formal definition (directly in 3NF)

A relational schema 'R' is in 3NF only if
in every non trivial FD $X \rightarrow Y$ either.

- i) x is a superkey (or)
 - ii) y is a prime attribute

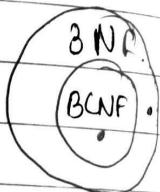

DB - BCNF introduction

A relational schema 'R' is in BCNF_{if} whenever a non trivial FD $X \rightarrow A$ holds in R, then X is a superkey of R i.e. determinants of all FD must be a superkey.

Ex R(ABC) + {AB \rightarrow C, C \rightarrow B}

A	B	C	In 3NF $X \rightarrow A$.	
0	1	1	① X is a superkey of R	② A is prime w.r.t X
1	1	2		
1	0	3		
0	0	4	All BCNF \rightarrow 3NF	
4			All 3NF \nrightarrow BCNF	
5	1	1	$c=1$	
6	1	1	$B=1$	
7	1	1		

In BCNF

AB \rightarrow C
SK
C \rightarrow B
PD

① X is a superkey
only one condition should
be satisfied.

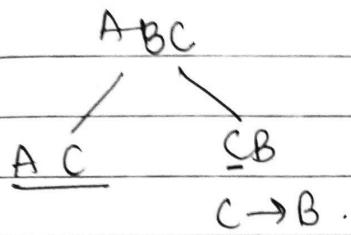

Not in BCNF
as C has PD.

$C^+ = \{CB\}$
AC & AB CK

ABC		AC		CB		C \rightarrow B		C \cup the CK	
A	C	A	C	C	B	C	B	C	B
0	1	0	1	1	1	1	1	1	1
1	2	1	2	1	2	1	2	1	2
2	3	1	3	2	3	2	3	2	3
3				3	0	3	0	3	0
4					0				

Since FD.

we will never get FD $AB \rightarrow C$ so we will lose the FD. fun. Dependency is not preserved.

BCNF

- 1) It is lossless
- 2) It may or may not be FD preserving.

Q. Given $R(A B C D E F G H I J)$ and
 $f: \{AB \rightarrow C, A \rightarrow DE, B \rightarrow F, F \rightarrow GH, D \rightarrow IJ\}$
decompose in BCNF.

$$AB^+ = \{A, B, C, D, E, F, G, H, I, J\}$$

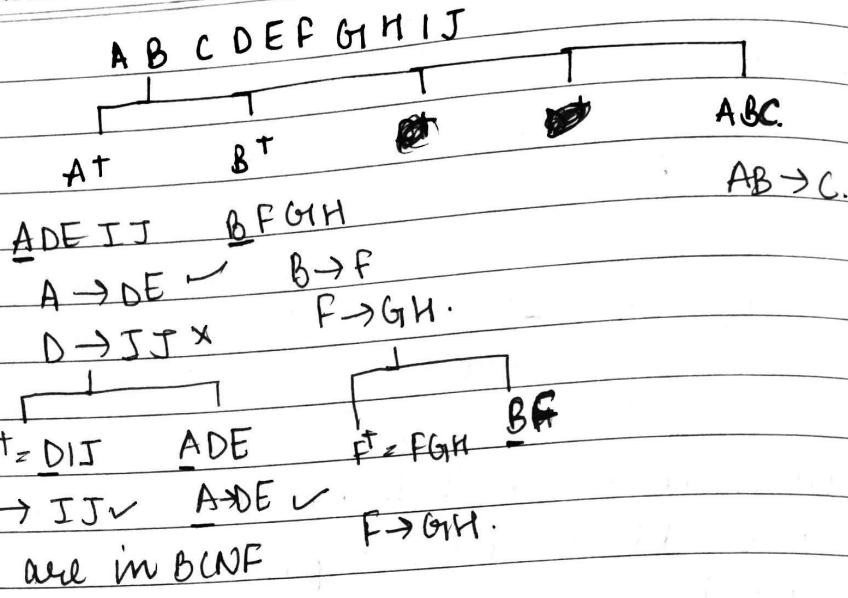

So, AB is the CK.

$AB \rightarrow C$	$A \rightarrow DE$	$B \rightarrow F$	$F \rightarrow GH$	$D \rightarrow IJ$
CK	PD	PD	NP	NP

$$A^+ = \{ A, D, E, IJ \}$$

$$B^+ = \{ B, F, G, H \}$$

Date _____ / _____ / _____

Q. R (ABCDEFGHIJ) and F: {AB → C, B → D, D → EF, A → GH, H → IJ}

$$AB^+ = \{ A, B, C, D, E, F, G, H, I, J \}$$

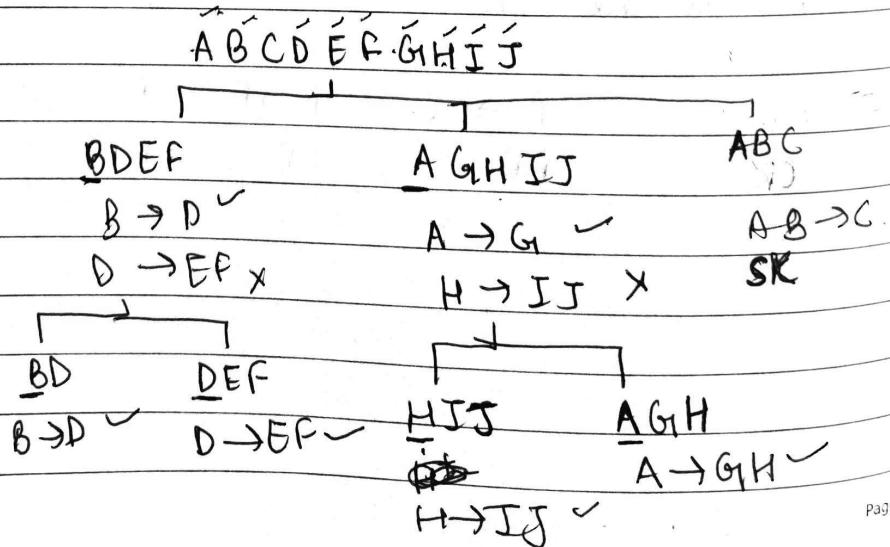

$AB \rightarrow C$	$B \rightarrow D$	$D \rightarrow EF$	$A \rightarrow GH$	$H \rightarrow IJ$
OK	PD	NP	PD	NP

$$B^+ = \{ B, D, E, F \}$$

$$D^+ = \{ D, E, F \}$$

$$H^+ = \{ H, I, J \}$$

$$A^+ = \{ A, G, H, I, J \}$$

BD, DEF, HIJ, AGH, ABC

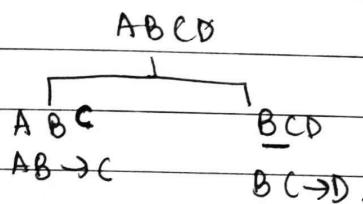

Q. R(ABCD)
F : { AB → C, BC → D }.
Decompose it to BCNF.

$$AB^+ = \{ A, B, C, D \}$$

AB is the CR.

$$\begin{array}{ll} AB \rightarrow C & BC \rightarrow D \\ CK & NP \end{array}$$

$$BC^+ = \{ B, C, D \}$$

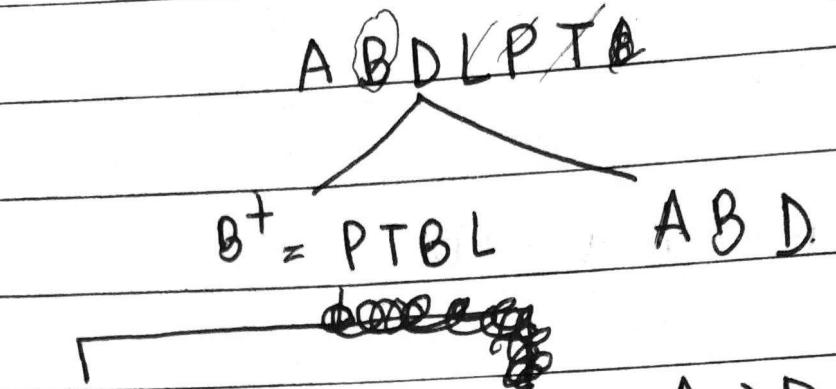

So, tables are ABC and BCD

Q. R(ABDLPT) and F: { B → PT, T → L, A → D }.
Decompose R into BCNF

$$AB^+ = \{ A, B, D, P, T, L \}$$

$$CK = AB$$

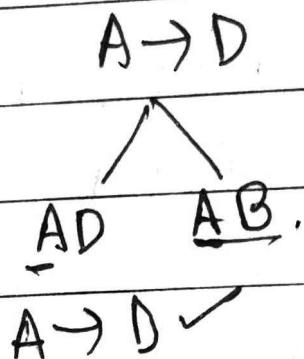

$$\begin{array}{lll} B \rightarrow PT & T \rightarrow L & A \rightarrow D \\ PD & NP & PD \end{array}$$

$B^+ = \underline{BPTL}$

$B \rightarrow PT \checkmark$

$T \rightarrow LX$

TL

BPT

$T \rightarrow L$

$B \rightarrow PT$

tables are TL, BPT, AD, AB.

A ~~B~~ D L P T

$$B^+ = P T B L \quad A B D$$

~~B~~ ~~L~~

A \rightarrow D

$$B^+ = \underline{B} P T L$$

B \rightarrow P T

A D A C

T \rightarrow L X

A \rightarrow D

T L B P T

T \rightarrow L B \rightarrow P T

tables are T L , B P T , A D , A B

Relational Algebra

Implement RDBMS - SQL

↑ At conceptual level we look at every table as
a subset of cross product of all its attributes.

Name	Age	Marks
		N A M
	X	
		→

Set

"Algo relational model: basics for RDBMS

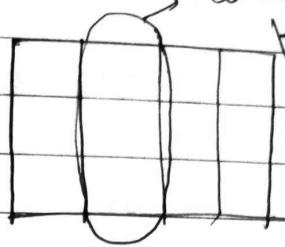

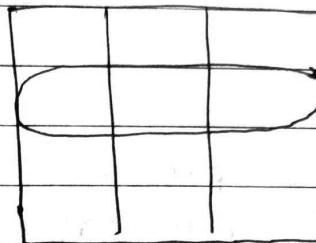

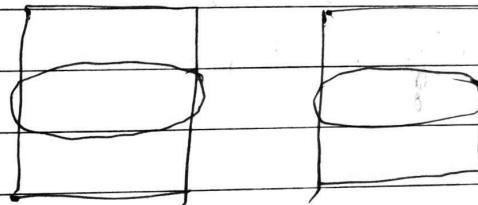

Relational + Relational
Algebra Calculus.

what we
want & how
want
we want

Basic

operations (unary)

 π - projection
(attributes)to select only
few columns σ - selection
(tuples)to select
only few
rows \times - cross productCombining 2 tables of
same or diff type

to compare tuples

 \cup - unionCombining 2 tables of
same type.

- → minus

In A but not in B.

A - B.

g → rename

to rename a table

sequence of operⁿ.

\cap : Intersection ($A - (A - B)$)

 : Join (αx)

$/$: Division ($\pi, \times, -$)

On cross product every tuple combines with every other table.

Join is an extension to cross product for selecting meaningful tuples.

DB Selection Operation (a) (Horizontal partitioning)

eno	ename	dno	salary
1	a	1	10K
2	b	1	11K
3	c	2	12K
4	d	2	14K
5	e	3	15K
6	f	3	16K

$\cap D_{No=3}$ {Emp})

Relational

relational algebra query
whose result is a
reln.

All the employee with $D_{no} = 1$ having salaries $> 10k$
 $\alpha_{D_{no}=1} (\alpha_{\text{Emp}})$ or $\alpha_{\text{Salary} > 10} (\alpha_{D_{no}=1} \text{ (Emp)})$

Nested expression

- * Selection is commutative
- * Degree remains same.
- * $\alpha_A (\alpha_B (E)) \cong \alpha_B (\alpha_A (E))$

$(\alpha_{\text{Salary} > 10} \text{ AND } \alpha_{D_{no}=1} \text{ (Emp)})$

↑

Boolean connectivity

$|\alpha_C(R)|$

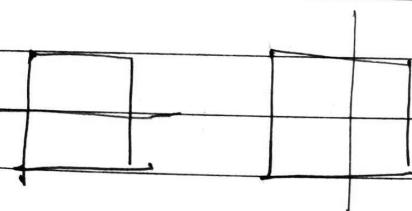

min max.
0 $|R|$

$0 \leq \alpha_C(R) \leq |R|$

DB-projection operation (π) (vertical

partitioning)

Emp

$\pi_{x,y}(\text{Emp})$

x	y	z
1	a	c
1	b	c
2	a	c
2	b	c

x	y
1	a
1	b
2	a
2	b

%p of any RA expression is
a relation.

Degree may be variant in the result

Cardinality is not always same.

$$\pi_z(\text{emp}) = \begin{array}{|c|} \hline z \\ \hline c \\ \hline \end{array}$$

RA is derived from relational model so
duplicates are removed.

$$\pi_x(\text{emp})$$

X
1
2

$$\pi_y(\text{emp}) =$$

Y
a
b

Syntax :

π [attribute list] Reln

As long as you project superkey on attribute
just you might get all the tuples.

- * It is not commutative.

$$\pi_x(\pi_{xy}(\text{emp})) \neq \pi_{xy}(\pi_x(\text{emp}))$$

(Duplicates SELECT
allowed) \cong Projection. (Duplicates are
not allowed)
SELECT distinct \cong Project^n.

Q. Which of the following query transformations
 (i.e. replacing LHS by the RHS expression)
 is incorrect? R_1 & R_2 are reln's. C_1 and
 C_2 are selection conditions and A_1 & A_2
 are attributes of R_1 .

a) $\sigma_{C_1}(\sigma_{C_2}(R_1)) \rightarrow \sigma_{C_2}(\sigma_{C_1}(R_1))$

b) $\sigma_{C_1}(\pi_{A_1}(R_1)) \rightarrow \pi_{A_1}(\sigma_{C_1}(R_1))$

c) $\sigma_{C_1}(R_1 \cup R_2) \rightarrow \sigma_{C_1}(R_1) \cup \sigma_{C_1}(R_2)$

d) $\pi_{A_1}(\sigma_{C_1}(R_1)) \rightarrow \sigma_{C_1}(\pi_{A_1}(R_1))$

cond'n may be applied
 on all or any attribute

cond'n is imposed on A_1
 only.

b)

A_1	A_1	A_2	A_3
a_1	a_1		
b_1	b_1		
c_1	c_1		

c) $R_1 \cup R_2$

$R_1 \cup R_2$

d)

A_1	A_2	A_3
1		
	1	
		1

A_1	A_2	A_1'	A_2'

A_1	A_2	A_3
1		
	1	
		1

Q. Suppose $R_1(A, B)$ and $R_2(C, D)$ are 2 relations. Let r_1 & r_2 be the corresponding reln. instances. B is a foreign key that refers to C in R_2 . If data in r_1 & r_2 satisfy referential integrity constraints. Which of the following is always TRUE?

- a) $\pi_B(r_1) - \pi_C(r_2) = \emptyset$ T
- b) $\pi_C(r_2) - \pi_B(r_1) = \emptyset$ F
- c) $\pi_B(r_1) = \pi_C(r_2) = \emptyset$ F
- d) $\pi_B(r_1) - \pi_C(r_2) \neq \emptyset$

r_1	r_2 (instance name of table)																					
<table border="1"> <thead> <tr> <th>R_1</th><th>A</th><th>B</th></tr> </thead> <tbody> <tr> <td></td><td>1</td><td></td></tr> <tr> <td></td><td>2</td><td></td></tr> </tbody> </table>	R_1	A	B		1			2		<table border="1"> <thead> <tr> <th></th><th>C</th><th>D</th></tr> </thead> <tbody> <tr> <td></td><td>1</td><td></td></tr> <tr> <td></td><td>2</td><td></td></tr> <tr> <td></td><td>3</td><td></td></tr> </tbody> </table>		C	D		1			2			3	
R_1	A	B																				
	1																					
	2																					
	C	D																				
	1																					
	2																					
	3																					

$$\{1, 2\} - \{1, 2, 3\} = \emptyset$$

$$\{1, 2, 3\} - \{1, 2\} \neq \emptyset$$

$$\{1, 2\} \neq \{1, 2, 3\}$$

$$\{1, 2\} - \{1, 2, 3\} = \emptyset$$

DB rename operations (ρ)

Emp

A	B	C

$\pi_{A, B}(r_C(Emp))$

A	B

$\rho_x(c, d) \pi_{A, B} (a_c (\text{emp}))$

renaming table emp as X and
renaming attributes A, B as C, D.

A \bowtie A
join

$\rho_x (\text{emp})$

Rename employee as
 X

Only attributes $\rho_x (c, d, e) (\text{emp})$

$\downarrow \rho (c, d, e) (\text{emp})$

for few attributes $\rightarrow \rho (x, y, c) (\text{emp})$

$\rho_x (s, t, c) (\text{emp})$

DB - set operations
 $\cup \cap$ - (binary)

RUS \rightarrow R and S should be union all type
compatible.

$\bullet R (r_1, r_2, r_3)$

$S (s_1, s_2, s_3)$

same degree

emp_c₁ (ename, eid)

emp_c₂ (enamel, ei)

union will never contain duplicate values.

RUS = SUR (commutative)

R(UVT) = (RUS)UT (associative)

\cap

RNS both the tables should be union compatible (same attributes & domain)

RNS = SNR (commutative)

\rightarrow R(SNT) = (RNS)NT (associative)

(R-S) both the tables should be V compatible.

Result

would be

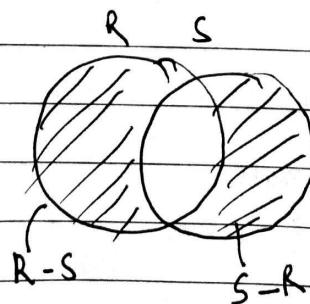

named R

	S			
as R :	a	b	c	d
1	2	x	1	2
3	4	v	7	8
5	6	v	9	10

R	
3	4
5	6

R-S ≠ S-R (not commutative)

R-(S-T) = (R-S)-T (associative)

$$RNS = ((RUS) - (R-S)) - (S-R)$$

$$RNS = R - (R-S)$$

DB - Cartesian Product

Cartesian product (\times) \rightarrow we will get ordered pairs.

R (emp)			S (dep)		
A	B	C	D	E	
1	a	b	1	c	degree = 2 (L)
2	c	d	2	d	
3	e	f			

RxS	Empid	Empid			
A	B	C	D	E	
1	a	b	1	c	$3 \times 2 = 6$ tuples
1	a	b	2	d	
2	c	d	1	c	$ R = m \quad S = n$
2	c	d	2	d	$ RxS = (m \times n)$
3	e	f	1	c	
3	e	f	2	d	

To examine or compare 2 tuples from 2 diffn. tables. We can get the name of employee & name of dependent.

$\delta_{A=D}$	(RxS)
emp	dep

A	B	C	D	E
1	a	b	1	c
2	c	d	2	d

In general we use Cartesian product with selection to get some meaningful data.

Date _____

subset of product
Cartesian product

DB-Join (\bowtie)

(extension for cartesian product)

 $X, a \bowtie$

R	A	B	C
S	D	E	

$$\sigma_{A=D} (R \times S) \cong R \bowtie S. \quad \langle A=D \rangle$$

$$(R \bowtie S) \quad \begin{matrix} (i) \\ (ii) \end{matrix}$$

$\leftarrow \text{join cond'n}$

condⁿ1 AND condⁿ2

$$A=D \text{ AND } B=E.$$

$$R \quad \bowtie \quad S \quad (\kappa + \ell \text{ attributes})$$

$\langle A=D \text{ AND } B=E \rangle$

Join = Only comparing 2 attributes $(A=10) \times$
 not join

$$0 < R \bowtie S < m \times n.$$

DB-Natural join (*)

\downarrow
 (2 tables, common attribute
 same name)

Emp		Dep	
empid		eid	
	x		

$$R * S \underset{\langle A=A \rangle}{\cong} R \bowtie_{\langle A=A \rangle} S \underset{\langle A=A \rangle}{\cong} \sigma(R \times S)$$

(A)	B	C	(A)	D
-----	---	---	-----	---

(should have the same)

if

(A)	B	C	(E)	D
-----	---	---	-----	---

rename

$$R * \rho_{(A,D)}^{(S)}$$

A	B	C	A	D
1	a	b	1	d
2	c	d	3	e

A	B	C	D
1	a	b	d

common attributes
needs not be written
2 times

A	B	C	A	B
1	a	b	1	a
2	c	d	3	e

A	B	C
1	a	b

- 1) attributes might change $0 < R * S \leq m * n$
 2) can be applied on any no. of tables

When names of attributes are not same then
natural join is equal to the cartesian product

	A_1	A_2			
	A	B	C	D	E
1	a	b		1	a

	☒☒☒	'n'	mn
	☒☒☒☒	mn (when all the tuples are matching with all the tuples of other side)	mn(m,n)

14. DB - Extended RA opertns

Generalized projection : Can use arithmetic opern. such as +, -, *, ÷ on numeric attributes, numeric constants and on an expression that generate numeric result. Also permits opern on other datatypes such as concatenation of strings.

eg: $\pi_{ID, name, dept_name, \text{salary} \div 12}$ (Instructor)

Aggregate function: (SUM, AVERAGE, MAX, MIN, COUNT, COUNT-DISTINCT)

$f_{\langle \text{functionlist} \rangle (R)}$ (Employee)
 COUNT SSN,
 AVERAGE SALARY

SSN → Social Security number.

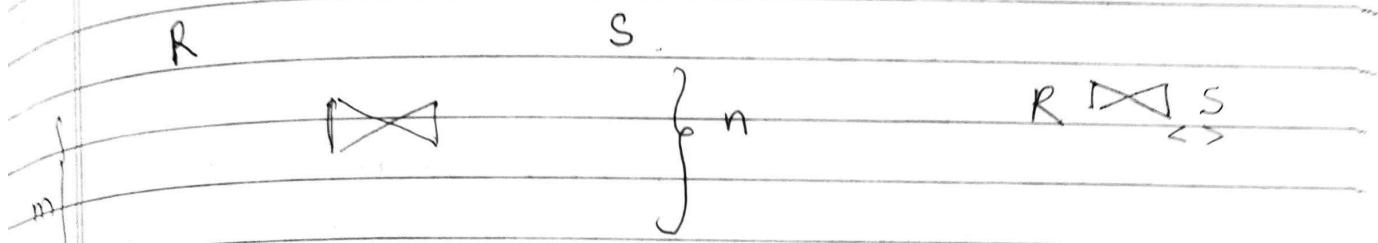

Aggregate functions with GROUP BY.

$f_{(DNO, NO, AVG(SAL)) DNO}$ COUNT SSN, AVERAGE SALARY (Emp)

Q Consider the join of a relation R with a relation S. If R has m tuples and S has n tuples, then the max^m and min^m sizes of joins are respectively?

- a) $m+n, 0$
- b) $mn, 0$
- c) $m+n |m-n|$
- d) $mn, m+n$

$$\min^m = mn, 0$$

Q. The relational algebra expression equivalent to the following tuple condition calculus expression

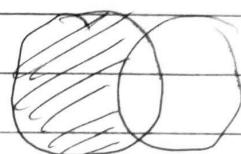

$$\{ t / t \in \alpha \wedge (t[A] = 10 \wedge t[B] = 20) \}$$

a) $\sigma_{(A=10 \vee B=20)} y$

$A = 10 \quad B = 20$

b) $\sigma_{A=10} (\gamma) \cup \sigma_{(B=20)} (y)$

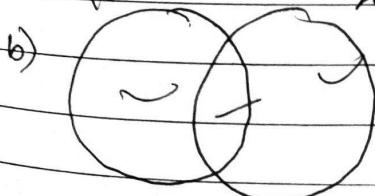

d)

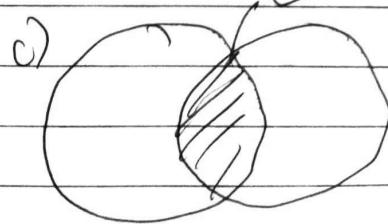

c) $\sigma_{A=10} (\gamma) \bowtie \sigma_{(B=20)} (y)$

d) $\sigma_{A=10} (\gamma) - \sigma_{(B=20)} (y)$

b) $10 \quad A \quad B \quad 20$

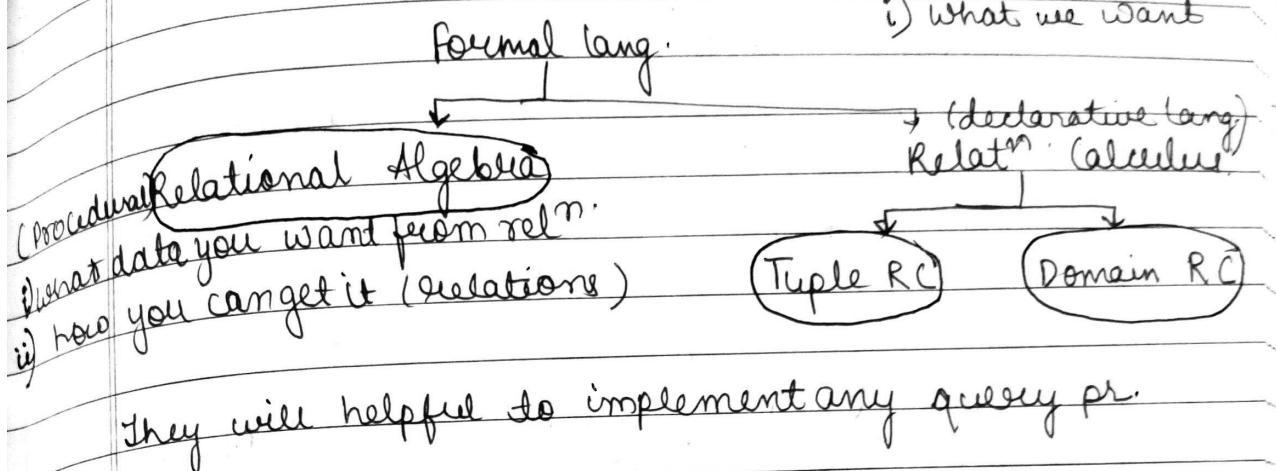

$A = 10 \quad B = 20$

Introduction to relational Calculus.

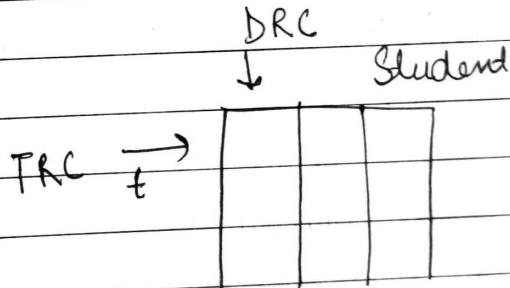

* If a language is able to express everything a RA can then it is called as relationally complete.

we generally range over the column.

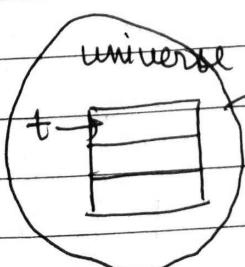

TRC, DRC, RA \rightarrow relationally complete

take each
tuple at a time
& examine

Unsafe operatⁿ. Student (t)

$\sim t \rightarrow$ all the tuples not
in student table.
(infinite).

$\sim t$ RA and RC are
of same power but
due to unsafe operatⁿ.
RA is more powerful
than RC (Relational
calculus).

DB TRC Syntax

Student

FN	LN	marks
a	b	100
b	c	40
c	f	60

FN of student
having marks > 50

$\{$

$t \cdot FN$

t | Student (t) AND $t \cdot M > 50$ }

set of
all attributes
in final op.

tables AND Condition

$\{ t_1 \cdot A_1, t_2 \cdot A_2, \dots | T_1(t_1) \text{ AND } T_2(t_2) \dots \text{ AND } t_1 \cdot A_1 \}$

DB - FREE AND BOUNDED variables :

$\{ t_1 \cdot A_1, t_2 \cdot A_2 \}$

Bounded
variables

expression

atomic (simple) or

composite (complex)

Emp

$t \rightarrow$	A
	21
	20

$\rightarrow \text{Emp}(t)$

$A, \wedge A_2$ AND

$\rightarrow t \cdot A > 20$

$A_1 \vee A_2$ OR

$\rightarrow t_1 \cdot A_1 > t_2 \cdot A_2$

$\neg A_1$ NOT

$t_1 \rightarrow A_1$

$t_1 \rightarrow A_1$		

$t_2 \rightarrow A_2$

$t_2 \rightarrow A_2$		

$\exists t ()$

Quantifier
for all
 t

$\forall t ()$

Unit for processing → Entire
Bounded table
variables

One tuple.
Free variable

$\exists t () \quad \} \text{ no quantifiers}$
there exists
t

forall $\forall t () \quad \} \text{ having quantifiers}$
t

$\exists t (t(A) > 50)$ False
 there exists atleast one tuple
 such that a A value is 50.

A	B
10	1
20	2
30	3
50	4

$\forall t (t(B) < 10)$
 True

processing the entire table | processing step by
 step.

In bounded variable we have to check the entire table i.e if $t(B) < 10$ then only it will return true or false but in case of free variable only one tuple needs to checked each time.

$\neg \exists t (t(A) > 50)$
 doesn't exist

$\exists t (t(A) > 50)$
 there exists

Q19. Let r be a relation instance with schema

$R = (A, B, C, D)$. We define $r_1 = \pi_{A, B, C}(r)$

and $r_2 = \pi_{A, D}(r)$. Let $s = r_1 * r_2$, where $*$ denotes natural join. Given that the decomposition of r into r_1 & r_2 is lossy.

Which one is true?

- i) $s \subset r$
- ii) $r \cup s = r$
- iii) $r \subset s$
- iv) $r * s = s$.

{ }
as the

SQL

E.F Codd - A relational model of data for large shared data banks.

RAYMOND and DONALD: SEQUEL

structured English query language

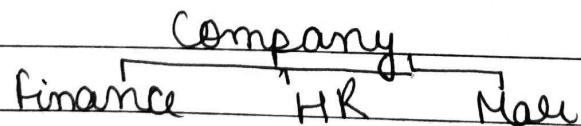

SQL

- 1) It is based on RA and TRC
- 2) First implemented on System R by IBM
- 3) Oracle, Microsoft SQL Server, MS Access, MySQL etc
- 4) Portable
- 5) Basics and extensions

Creation of Schema

Schema: Groups logical objects together.

For privacy concerns we group objects together.

Syntax: CREATE SCHEMA Schema_name [AUTHORIZATION owner_name]

CREATE SCHEMA FINANCE AUTHORIZATION RAVI;
GRANT SELECT ON FINANCE *.* TO user;

Create Table

Syntax: CREATE TABLE <tablename> (<col1>datatype(width),
 <col2> datatype (width); ...);

Eg: CREATE TABLE Customer (Name varchar(20),
 cust_id Number,
 Address varchar(50));

Datatypes: We have numerous datatypes in SQL

Numeric	Character	Date	Boolean
NUMBER	CHAR	DATE	BOOLEAN
FLOAT	VARCHAR2	TIME	
INT	NCHAR	TIMESTAMP	
REAL	NVARCHAR2	INTERVAL	
DECIMAL	LONG		
BINARY	RAW		
FLOAT	LONG RAW		

Constraints: We have 7 constraints in SQL

- 1) NOTNULL (the attribute shouldn't contain null value)
- 2) UNIQUE (no two tuples can have same value)
- 3) Primary key (should be unique + NOTNULL)
- 4) Foreign key (referential integrity (attribute in table referring to attribute of other table))
- 5) CHECK (sometimes we need to check any attribute)
- 6) DEFAULT (default value is set when there is no value)
- 7) REF constraints (

Our requirement is:

Dept table with dep_id(PK) dept_name (UNIQUE),
location.

CREATE TABLE DEPARTMENT(

dep_id NUMBER PRIMARY KEY,
dept_name VARCHAR2(30),
location VARCHAR2(100),
UNIQUE (dept_name));

Constraints could be defined at 2 levels.

a) column level
↓

dep_id NUMBER PRIMARY KEY

Specifying the constraints
along with the column
name.

b) table level

dept_name VARCHAR2(30)
UNIQUE (dept_name));

Specifying the constraint
at the last of the
columns.

- * NOT NULL should be specified at column level
- * composite key should be specified at table level.
(more than one attribute as key)

Emp: emp_id(PK) emp_name (NOT NULL)
job, dept_id (referring to dept_id of Dept)
mgr, salary (> 5000),
comm (if not given default 100)
email,
phone, unique.

CREATE TABLE EMPLOYEE (

emp_id NUMBER PRIMARY KEY,
 emp_name VARCHAR(30) NOT NULL
 dept_id NUMBER REFERENCES Dept(dept_id),
 job VARCHAR(2(30)), mgr VARCHAR(30)
 salary NUMBER CHECK (Salary > 5000),
 comm NUMBER DEFAULT 100,
 email VARCHAR(30),
 phone VARCHAR(12),
 UNIQUE (email, phone));

DB-INSERT.

Insert: It is used to insert data.

Syntax: In that order

INSERT INTO <tablename>
 values (attr. value, attr. value2, ...)

Ex: INSERT INTO Dept

value (1, 'CSE', 'Hyderabad')

Syntax 2: In other order.

INSERT INTO <tablename> (attr1, attr2, attr3...)
 values (attr-value1, attr-value2, ...)

DB - delete and Update

Delete : Delete the data from existing table.

Syntax :

`DELETE FROM <table name>`

`WHERE < condition >;`

`Delete * from Emp;`
Emp.

(table
exists)

`DROP TABLE Emp;`

(table &
data deleted)

Dept			Emp		
dept_id	dept_name	locn	emp_id	dept_id	ename
2	ece	kgp	2	2	def
3	ece	hyd.	3	1	ghi

Delete from Dept

where dept_id = 1; → Referential integrity
gets violated

Drop : deletes both the data & table

Syntax : `DROP TABLE <table.name>`

We can't use insert after drop.

Update : Used to update the data.

Syntax:

```
UPDATE <table name>
SET <attr> = <Value>
WHERE <condn>;
```

Eg:

Update Emp.

SET dept_id = 1

WHERE emp_id = 2;

DB - Referential triggered actions

Referential integrity gets hindered when you try to update or delete the data. So to maintain the referential integrity

dept_id	dept_name.	emp_id	dep_id
1	CSE	1	3
2	ECE	2	2
3	EEE	3	4
4	IT	4	6
5	CE	5	5
6.	ME	6	1

On delete On update

- ① Set Null
- ② Set default
- ③ set Cascade

It allows us to further describe the relationship between the ref. column and the object it references by attaching a 'referential triggered action' to the foreign key.

3 actions are

- 1) SET NULL
- 2) SET Default
- 3) SET cascade

SET NULL

```
CREATE TABLE Emp (emp_id NUMBER,
Dept_id NUMBER REFERENCES Dept(dept_id)
ON DELETE SET NULL ON UPDATE SET NULL)
```

Ex: DELETE FROM Dept
WHERE dept_id = 1;
UPDATE Dept
SET dept_id = 7
WHERE dept_id = 6;

SET Default (default value is never be deleted
to maintain the integrity constant)

~~DELETE~~

Ex:
dept_id NUMBER DEFAULT 3 REFERENCES Dept(dept_id)
ON DELETE SET DEFAULT ON UPDATE SET DEFAV

DELETE FROM Dept WHERE dept_id = 2;
UPDATE Dept SET dept_id = 8 WHERE dept_id

SET CASCADE

dept_id NUMBER REFERENCES Dept(dept_id)
ON DELETE SET CASCADE ON UPDATE SET CASCADE

DELETE FROM Dept WHERE dept_id = 4;

UPDATE Dept SET dept_id = 9 WHERE dept_id = 5;

DB Alter

Alter: It is used to add, delete or modify column in an existing table.

Also used to add and drop various constraints on an existing table.

Create table Emp(emp_id NUMBER, emp_name char(10)
UNIQUE, Salary NUMBER
check(Salary > 5000),
Phone varchar(13);
pincode varchar(6));

ALTER TABLE Emp

ADD PRIMARY KEY(emp_id);

ALTER TABLE Emp

DROP UNIQUE (emp_name);

A

ALTER TABLE Emp

MODIFY CHECK (Salary > 1000);

for attributes

ALTER table Employee

- ① ADD Add varchar(30);
- ② MODIFY phone varchar(20);
- ③ DROP COLUMN pincode;

DB - Select

Used to retrieve data from database.

Syntax: `SELECT <attr_list> π
FROM <table_list> ×
WHERE <conditions>; a`

Attr_list : list of all whose values are to be retrieved by the query.

Table list : list of tables from which we retrieve the data.

Condition: Conditional [Boolean] expressions that identifies the rows retrieved by query.

Dept		Emp				
dept_id	deptname	emp_id	dept	emp_name	Job	
1	CSE	1	5	Sindhu.	9	
2	IT	2	2	Srinivas.	6	
3	ECE	3	1	Santosh	8	
4	EEE	4	2	Sauanya	8	
5.	ME	5	4	Sindhu	6	
		6	3	Sauanya	6	

Q. Retrieve the names of all employee who work
for dept 1.

Select emp_name
from Employee
where dept = 1;

Q. Retrieve the names ,emp_id of the employees who
work for IT dept.

Select emp_name, emp_id
from Employee, Dept
where dept = dept_id
AND dept_name = 'IT';

Q. Retrieve the jobs of all employee.

Select Job from Emp; {a,b,a,a,b,c}

Select distinct Job from Emp; {a,b,c}.

DB_view :

dept_id	dept_name	stud_id	stu_name	dept
1	CSE	1	Sindhu	2
2	ECE	2	Salomya	1
3	ME	3	Seinivas	3
4	EEE	4	Santosh	2
5	CE	5	Subbu	4
		6	Sinchani	2
		7	Satish	2

Create table Student-ece as
 (Select stu-name, stu-id
 from student, Dept
 where dept = dept-id AND
 dept-name = 'ece');

Same data at multiple places \rightarrow coherence

Dynamic table - view.

View: It is a virtual table based on the result set of a SQL statement.

Syntax: CREATE VIEW <view name> AS.
 (Select <column name> FROM <table name>
 where <condition>)

DB-Aliasing

SQL aliases are used to rename a table or a column in a table.

- Q. For each employee retrieve employee's id, name, salary & the name of his/her immediate supervisor.

Dept_id	Dept-name
1	Accounting
2	Sales
3	Research
4	Finance

Emp

emp_id	dept_id	sup_id	Sal	emp_name
1	1	7	11000	Sindhu
2	3	4	2200	Seumya
3	1	7	2100	Sentoch
4	4	7	3000	Satish
5	2	4	2000	Linchani
6	1	7	5000	Murali
7	1	-	1500	Ravi

Select E.emp_id AS "Employee_id", Employee_id | Salary | employee_name
 E.sal AS "Salary",
 E.emp_name AS "Employee_name",
 S.emp_name AS "Supervisor_name"
 FROM EMP AS E, EMP AS S
 WHERE E.^{sup}emp_id = S.emp_id ;

Retrieve the ^{id} name of employee and their corresponding name of dep.

Select E.emp_id AS "Employee Id",
 D.dept_name AS "Department_name".
 FROM Emp E , Dept D.
 WHERE E.dept_id = D.dept_id ;

DB-Pattern Matching

LIKE : It is used to search for a specific pattern in a column.

We used 2 wild cards

- $\%$ → represents any sequence of 0 or more characters.
- $_$ → used to replace a single character.

$a\%$ → first character in the name is a.

a_* → second character in the name is $\overset{a}{\underset{\text{any}}{\sim}}$.

$\%a$ → ending with a.

$\%a_*$ → last one char is a.

Q. Retrieve all the students whose name starts with R.

Select * from student

WHERE name like 'R%';

Q. Display the names of students who secured 4 digit rank.

Select name from student

WHERE rank like '____';

$\%$ as the second symbol use escape sequence to search full data field as $\%\%$.

Select name from student where marks like '90%' escape '\%' and email like 'abc_\%\@\%\.\%\%' escape '\%'.

NOT LIKE

where name NOT LIKE 'R%';

name of students whose name
doesn't start with R.

DB Set Operations.

Union (\cup)

Intersect (\cap)

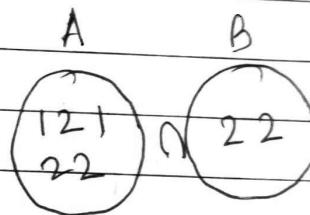

Except ($-$)

} duplicates are not allowed.

Union all

Intersect all

Except all

Retrieve the list of students who got either grade 'A' or grade 'B'. (with duplicates)

Select studId from Enroll

where grade = 'A' ;

Union All .

Union = (1, 2)

Union all = (1, 2, 1

2, 2)

Select studId from Enroll .

where grade = 'B' ;

Both grade 'A' and grade 'B' .

Select StudId from Enroll where grade = 'A' ;

Intersect All .

Select StudId from Enroll where grade = 'B' ;

Intersect = (2)

Intersect All No. (2, 2)

who got ~~not~~ grade 'A' but not grade 'B'.

Select StudId from enroll where grade = 'A';

Except

Select StudId from enroll where grade = 'B';

Except = { 1 };

Except All = { 1, 1, 2 };

DB Arithmetic Operators

SQL allows use of arithmetic operators in queries on numeric domain.

- Q. Increase the salary of an employee by 10% and display the salary and employee name.

Select EmpName, Salary * 1.1 From Employee;

- Q. CONCATENATE - For string datatype the concat operator '||' can be used in a query to append 2 string values.

Select Fname || Lname AS "Full Name"
from Employee;

BETWEEN - It is a comparison operator on numeric datatype

- Q. Retrieve all the employees whose salary is between 30,000 and 50,000.

Date / /
Select * from Employee
where salary Between 30000 AND 50000;

NOT BETWEEN - vice versa on between

Between can be used on text & dates.

Select * from Employee where Emp-Name
Between 'A' and 'D';

Q/P A, AA, B, Ba, D, DaX

↓
greater
than
D not
displayed.

In case of strings

Between = [A, D] Inclusive

NOT Between = (A, D) Exclusive. (B, C, D)

Select * from Employee where .

hire date Between '1-JAN-2010' AND '1-JUL-2010';

DB - ORDER BY .

Order by is used to order all sort SQL query
in ascending or descending order.

Syntax : Select <column list> FROM
<table list> ORDER BY
<column 1> ASC/DESC, <column> ASC/
DESC;

A	B	C
1	2	3
1	2	1
2	1	3
2	1	1
3	5	4
3	4	3

Select A,B,C from R ORDER BY A,B,C;

In Asc order 1 2 1 ← O/P.

1 2 3.

2 1 1

2 1 3.

3 4 3.

3 5 4

Select A,B,C from R ORDER BY A DESC, B,C DESC

O/P → 3 4 3.

3 5 4

2 1 3

2 1 1

1 2 3

1 2 1

Order by Example

- Q) Retrieve the list of employee names, their dept, & project names they are working on ordered by dept name & within each dept. order

alphabetically by last name, fname.

Select d. Dname, e. Lname, e. fname, p. name from
 EMPLOYEE e, works_on w, PROJECT p, Department d
 where d. number = e. Dno AND
 e. ssn = w. essn AND
 w. pno = p. Pnumber;

Order by d. dname, e. lname, e. fname;

	Dname	Lname	Fname	Pname
1	a	a	b	p ₁
3	b	a	c	p ₂
2	a	b	c	p ₃
5	c	c	b	p ₃
4	b.	c.	b.	p ₂

DB null values.

Dealing with null values at diffⁿ context.

- i) Arithmetic expressions (+, -, *, /)
- ii) Logical expressions

1) A $A+1$ Null + arithmeticop = NULL

5 + 1 6

4 + 1 5

Null + 1 NULL

1 + 1 2

2) $1 < \text{NULL}$ unknown

($1 \uparrow^{\text{UN}}$ $<$ NULL) AND ($1 \uparrow^T < 2$)

Date: / /

A	B	A AND B	A OR B
T	T	T	T
T	F	F	T
F	T	F	T
F	F	F	F
T	UK	UK	T*
F	UK	F*	UK
UK	UK	UK	UK

for null values.

$$\text{NOT}(T) = F$$

$$\text{NOT}(F) = T$$

$$\text{NOT}(UK) = UK$$

DB Null values in various contexts

R

A	B
a	1
b	2
c	NULL
d	NULL

Select A

from R

where B = NULL X O/P nothing

where B IS NULL ✓

O/P c, d.

Where B IS NOT NULL

O/P → a, b

e

			a		
N			N		
a		X	a		
b			b		
c		X X	c		
NULL		X	NULL		
NULL		X X	NULL		

we don't get NULL
value in join
selection

using DISTINCT we can consider every Null as same

R

A	B.
a	1
b	2
c	NULL
d	NULL

Select B from R

1, 2, N, N

Select DISTINCT B from R

1, 2, N.

(1, 2, N, N) UNION (1, 2, N, N)

INTERSECT

(1, 2, 3, N) → (1, N)

IN Operator

The IN operator allows you to specify ~~multiple~~ multiple values in a where clause:

Syntax: Select column_name(s) FROM Table name
 WHERE Column_name IN (val1, val2...);

Ex: Retrieve the names of employees who works for the dept. 2, 3, 4, 5.

Select Name

From Employee

Where dept IN (2, 3, 4, 5);

Q. Find the FName, Address of employees who work for the department located in 'New York'.

Select FName, Address

From Employees

WHERE DNo IN

Subquery → (Select DNo from Dept Location
Where location = 'NEWYORK');

~~Correlated~~ \ ~~non correlated~~

Non correlated

Inner table could be executed first

Q. Retrieve the Fname, Lname of all managers.

Select FName, Lname

From Employee e

WHERE SSN IN

(Select MgrSSN from Department d);

Q. Retrieve the Fname of each employee who has a dependent with the Fname & same Sex as the employee

~~Correlated~~ Select (e.FName) FROM EMPLOYEE e

WHERE ^{e.SSN} IN (Select essn from ~~Dependents~~ department d)

WHERE (e.Fname = d.dependent name AND e.sex = d.sex)

- Q. find out all the employee id's who worked on same (or) any project on which employee 10 has worked for same number of hours.

Select distinct essn from WORKS-ON
 WHERE (Pno, hours) IN
 (Select pno, hours from WORKS-ON
 WHERE essn = 10);

essn	Pno	Hours
10	20	100
20	20	100
30	10	10
40	20	100
→ 10	20	20

20	100
30	20

$$10, 20; 40, 10 \Rightarrow 10, 20, 40$$

DB- Any / SOME , ALL ($>$, $<$, \geq , \leq , $=$)

- Q. find out names of all the employees whose salary is greater than all employees in Dno = 5.

Select Fname from Employee

WHERE salary > ALL(Select salary from Employee where Dno = 5);

ALL a, 11K (10K, 20K, 30K) X
 SOME / ANY a, 11K (10K, 20K, 30K) ✓

? any / = some \Rightarrow = in

= any b, 10K (10K, 20K, 30K) ✓

• in IN we can compare more than 2 values

only one value can be compared

< > (NOT Equal to)

< > some $\hat{=}$ < > Any \rightarrow not equal to any
 $\hat{=}$ NOT IN

DB - Exists / NOT Exists

The SQL exists condition is used in combⁿ with a subquery and is considered to be met if the subquery returns atleast 1 row.

Q. Retrieve the names of employees who have dependents with same fname, sex as that of the employee.

SSN	Fname	Sex	Select fname from Employee e	Dependent d	ssn	sex	dept
10	(a)	M	WHERE EXISTS (Select * from	→	10	m	a
30	b	F	Dependent d WHERE e.ssn = d.ssn AND e.sex = d.sex AND e.fname = d.dept		30	f	b

Q. Retrieve the names of the employee who have no dependent.

Select fname from Employee e

WHERE NOT EXISTS (Select * from Dependent
where ssn = e.ssn)

Date

DB - Examples on exists & NOT exists

list the frame of managers who have atleast one dependent.

Select frame from Employee e.

WHERE EXISTS (Select * from

dependent d where e.ss = d.essn

AND EXISTS (Select * from Department

Dept where e.ssn = Dept.Mgrssn);

Employee

Department

Dependent

Frame	SSN	Deptno	Mgrssn	essn
a	(10)			
b	20			
		(10)		→ (10)
				20

① He is manager or not

② He has dependent or not

Q. Retrieve the frame of each employee who works on all the projects controlled by dept number 5.

Select frame from Employee e

WHERE exists (Select pnum from WORKON w

WHERE Dnum = 5)

EXCEPT

(Select pno from WORKON w WHERE Dnum = 5 AND essn = w.essn)

A-B

Non correlated query

employee

Project

Works on

Fname	SSN	Pno	dNo	Pno	cSSN
a	(1)	(10)	5 ✓	10	(1)
		20	1	15	1
b	(2)	(30)	5 ✓	25	1
		(25)	5 ✓	30	1
				(40)	2

Select Fname from Employee e where NOT EXISTS

$(10, 15, 25) \setminus (10, 15, 25)$ returns True

$- (40)$

$(10, 15, 25, 30)$

returns

false.

O/p \rightarrow a.

DB Aggregate Function

Set

noduplicate

multiset

duplicate

Aggregate functions are functions that take a collection (a set or multiset) of values as input & return a single value.

9) AVG : Average

MIN : Minimum

MAX : Maximum

~~TOTAL~~ SUM : Total

COUNT : Count

Date / /
Select AVG(salary)
from emp;

Select COUNT(salary) → how many salary
from emp;

AVG(MARKS_A + MARKS_B)

WHERE SUM X not allowed where with
Aggregate funcn

Dealing with NULL values in Aggregate funcn.

All aggregate funcn except count(*) ignore
NULL values in their input collection.

* The count of an empty collection is defined to
be zero(0) & all other aggregate opertn's return
a value of NULL when applied on an
empty set.

A	B	count(*) = 4	Sum(A) = 6
1	N	rule [count(A) = 3]	Avg(A) = 2
2	N	ignored	MAX(A) = 3
N	N	Count(B) = 0	MIN(A) = 1
3	N		

$$SUM(B) = N$$

N → null

$$AVG(B) = N$$

$$MAX(B) = N$$

$$MIN(B) = N$$

DB Group By clause.

- Q. For each department that has more than 5 employees retrieve the department name & the number of its employees who are making more than 40,000.

Select Dname, count(*)

FROM Department, Employee WHERE
Dnumber=Dno AND Salary > 4000 AND

Dno IN (Select Dno from Employee
(GROUP BY Dno Having count(*)>5)
GROUP BY Dname;)

- Q. Find the avg salary in each dept.

Select Dno, Avg(salary)
FROM Employee
GROUP BY DNo;

Employee

SSN	Dno	Sal				
10	1	100		1	100	1 250
20	2	200		1	400	2 350
30	3	300		2	200	3 450
40	1	400		2	500	
50	2	500		3	300	
60	3	600		3	600	

Date / /

All attributes used in GROUP BY clause need to appear in the Select clause. Any attribute that is not present in GROUP BY clause must appear only inside the aggregate in the select clause.

→ for filtering group HAVING clause. SF W G(H)

Only Group by is there, then there is Having.

Ex: list the dno with Avg salary > 20000.

Select Dno , Avg(salary)
FROM employee
GROUP BY Dno.

HAVING AVG(salary) > 20000;

DB - Create 2012.

Consider the following reln. A, B, C.

A:	ID	Name	Age	B:	ID	Name	Age	C:	ID	Phone	Ag
	12	Arun	60		15	Shrey	24		10	2200	02
	15	Shrey	24		25	Hari	40		99	2100	01
	99	Rohit	11		98	Rohit	20				
					99	Rohit	11				

How many tuples does the result of the following SQL query contain?

Select A.ID from A WHERE A.Age >

A.H (select B.Age FROM B WHERE

B.NAME = 'Arun');

B

age

ALL (empty set)

	A
12	
15	
99	

Ans: 3

DB_With Clause

The SQL "with" clause allows you to give a sub-query block a name, a process also called sub query factoring which can be referenced in several places within the main SQL query.

The name assigned to sub-query is treated as though it was a view or table. It is basically a drop in replacement to the normal sub query.

Ex: Select emp_id from Employee;

Using with : WITH Emp_tab AS(Select emp_id
from Employee)

Select * from Emp_tab;

Multiple WITH clauses:

WITH Dept_temp AS(Select dept_id from Department
WHERE d_name='(SE)'),

Emp_name AS(Select emp_name from employee E,
Dept_temp D WHERE E.deptid = D.dept_id)

Date

Q. For each employee, display the number of employees working in their respective department.

Select e.ename AS emp-name, DC.dept_count AS emp_dept_count FROM emp e,
 (Select dept_no, count(*) AS dept_count
 FROM emp GROUP BY dept_no) DC
 WHERE e.dept_no = DC.dept_no;

WITH:

WITH dept_count AS (Select deptno, count(*) AS dept_count
 from emp GROUP BY dept_no)

Select e.ename AS emp-name, DC.dept_count AS
 emp_dept_count
 FROM emp e, dept_count DC
 WHERE e.dept_no = DC.dept_no;

R

Joins

A	B
1	
2	
3	
4	
5	
6	

1) Normal Join

Select * from (R JOIN S ON A=C)

S

C	D

Normal Join takes place when we provide any condition.

R		S	
A	B	C	D
1	a	1	g
2	b	2	h
3	c	3	i
4	d	7	j
5	e	8	k
6	f	9	l

Select * from (R JOIN S ON A=C)

A	B	C	D
1	a	1	g
2	b	2	h
3	c	3	i

- 2) Natural Join : Natural join doesn't have condition. So natural join only takes place when there is an ~~condition~~ matched attribute

Rename C as A

A	B	D
1	a	g
2	b	h
3	c	i

3. left outer Join: Join 2 tables add whatever is in left table.

A	B	C	D
1	a	1	g
2	b	2	h
3	c	3	p
4	d	N	N
5	e	N	N
6	f	N	N

4. Right Outer Join: Join 2 tables add whatever is right table.

A	B	C	D
1	a	1	g
2	b	2	h
3	c	3	p i
N	N	7	j
N	N	8	k
N	N	9	l

5. full outer Join: Add whatever present on left as well as right side.

Difference between Alter & Update

Alter

- 1) It is a DDL Command
- 2) It works on table structure

Update

- 1) It is DML command.
- 2) It works on table data.

update Emp

Set salary = salary * 2
where name = "A";

Emp

id	name	Salary	Email
1	A	10 000	
2	B	20 000	
3	C	30 000	

20 000
40 000
60 000

Difference between delete &
drop, truncate

(logs are there)

Rollback ✓

Rollback ✗

Delete has an option to apply condition
so its slow but truncate is fast

Constraints in SQL

(Condition or restrictions on DB)

Conditions are put upon columns.

①

Unique (no duplicate values)

2) NOT NULL \Rightarrow User can't leave the column empty

3) (unique + Not Null) Primary key - The column should be unique as well as not null

4) Check - Before entering the value it checks the value.

5) Foreign key - Used to maintain referential integrity.

6) Default \Rightarrow In case no data, there is any value.

4 | Niranjan | Varun | IT | 50000
5 | SQL queries & Sub queries

Q1. Write a SQL Query to display max m. salary from emp.

Q2. Write a SQL query to display Employee name who is taking maximum salary.

i) Select MAX(salary) from Employee;

ii) Select Ename from Employee
where salary = (Select MAX(salary)
from emp);

Q3. Write a SQL to display the record highest salary from the table.

Select Max(Salary) from Employee
where salary <> (Select Max(Salary)
from Employee);

Q4) Write a SQL query to display Employee name who is taking 2nd highest salary.

Select Ename from Employee
Where Salary = (Select Max2 salary) from
Employee where salary <> (Select Max1 salary
from employee);

$= \rightarrow$ Only 1 value $2=2$

6) Rpad ('Varun', 10, '*') Varun ****

Select rpad(name, 15, '*') from emp;

7) Trim ('V' from 'Varun')

Select trim('V' from name) from emp;

8) Replace ('Varun', 'V', 'T')

Transaction And Concurrency Control:

Transaction: Transaction is a colleⁿ of related Read & Write operⁿ used to perform some related task.

R(A)

$$A = A + 500$$

W(A)

R(B)

$$B = B - 500$$

W(B)

Commit

R(A) - Read operⁿ

W(A) - write operⁿ.

ACID

Atomicity - (All or nothing) \rightarrow Either execute all the operⁿ's of the transaction or none of them

Component of Database Responsible for it:

- 1) Recovery Management Component \rightarrow It takes care that either the atomicity is applied else rollback is done in case of error arises before commit.

How?

- 2) It maintains a log file till commit.

2) Consistency \rightarrow (No violation of ~~data~~ integrity constraints)

Rule \rightarrow "If the Database was consistent before a particular transaction, then it should also be consistent after that execution of the transaction."

Who is responsible?

\rightarrow It is user's / programmer's responsibility

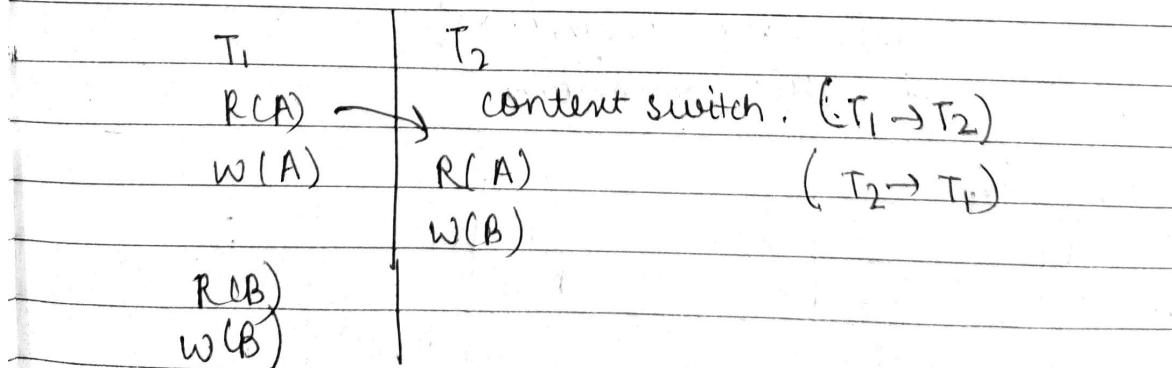

How does it do?

By setting various integrity.

3) Isolation

Concurrent Changes are Invisible

Rule \rightarrow "Concurrent Execution of 2 or more transactions should not cause any inconsistency. It should be as if the transaction executed independent of others."

4) Durability - (the committed update persists)
 The effect of a completed or committed transaction
 should be persist even after a crash.

It means once a transaction commits, the system must guarantee that the result will never be lost.

How?

- 1) By ensuring Recoverability
- 2) By using RAID → It keeps multiple copies of information in various databases.

R → Redundant

A → Array of

I → Independent

D → Disks.

Serializability : Basics & Classification

↓
 A Time order sequence of 2 or more transactions

Ex1: S1

T ₁	T ₂	T ₃	T ₁	T ₂	T ₃
R(A)			R(A)		
	R(A)			R(A)	
		R(A)			
W(B)			W(B)		
				W(B)	
					W(B)
			commit	commit	commit

$S_2 \rightarrow$ complete schedule (commit operation)

Schedule

Serial

Concurrent

If only after the commit of one transaction, the other transaction begins then the schedule is said to be serial.

A schedule consisting of interleaved execution of 2 or more transaction simultaneously is called concurrent schedule.

It satisfies all ACID prop.

	T ₁ R(A)	T ₂ R(A)	T ₃ R(A)
T ₁ (R(A))			
T ₁ (W(A))			
Commit T ₁			
T ₂ (R(B))			
T ₂ (W(B))		W(B)	
Commit T ₂		Commit	
			W(B)
			Commit

Advantages

→ No inconsistency

Disadvantages

→ Poor throughput

→ Poor resource utilization

Advantages

i) Better throughput

ii) Better resource utilization

Disadvantages

→ Inconsistency

form to the serialization?
→ serializability.

Serializability : Procedure & Conflict Serializability

The problem of inconsistency may arise in case of concurrent schedule.

soln → serializability.

Convert the concurrent schedule into an equivalent schedule which has a "serial order execution of its constituent transactions".

Concurrent schedule → equivalent serializable schedule
↓
is consistent

How to convert concurrent schedule to consistent concurrent schedule

- 1) conflict serializable
- 2) view serializable.

Conflict serializable.

A schedule is said to be "conflict serializable" if one of its conflict equivalent schedule is serializable.

*Page No. 3150
Date*

Conflict Equivalent schedule \Rightarrow If s' is a schedule formed after swapping the non conflict pairs in a given schedule s , then s & s' are called equivalent schedule.

Conflict pairs

R(CN)	W(CA)	W(CA)	R(A)	W(CA)	W(CA)
-------	-------	-------	------	-------	-------

O/P

A pair which ~~can't~~ change if the order of the execution of these conflict pair is inverted.

Non conflict pairs

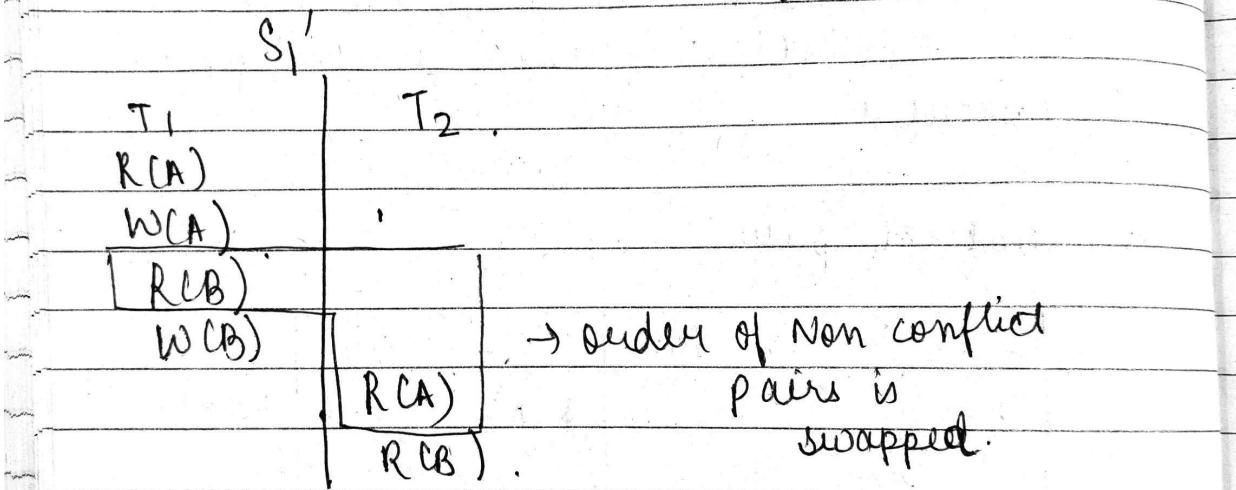

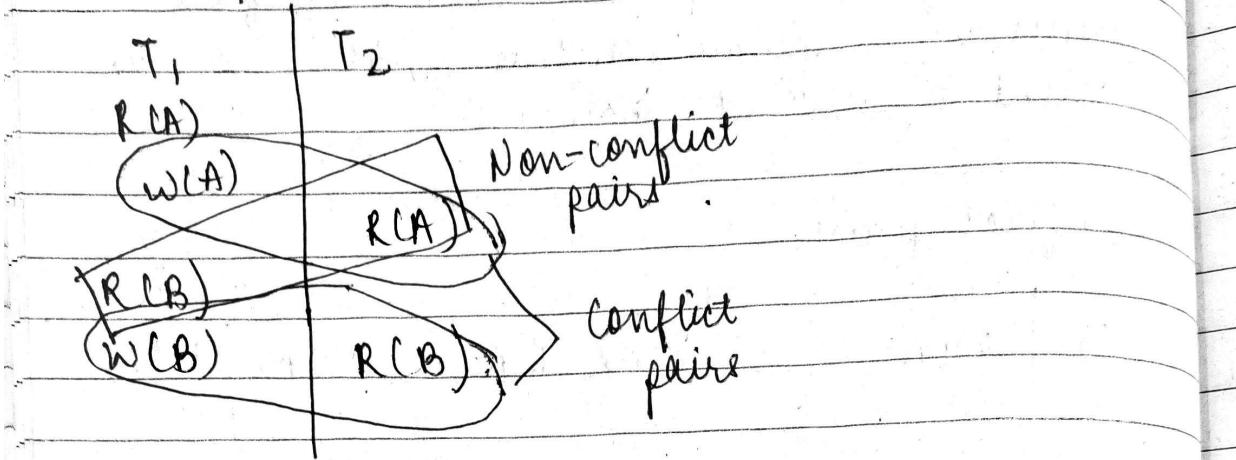

R(A)	R(A)	W(A)	
R(B)	R(A)	W(B)	

R(CA)	
W(CB)	

We can never swap the order of conflict pairs.

As by doing so, the final result changes & the schedules no more remain equivalent.

Finding a conflict equivalent schedule

Order: $T_1 \rightarrow T_2$.

Conflict equivalent schedule.

Precedence Graph.

Example 1: $R_1(x) R_1(y) \quad R_2(x) R_2(y) \quad W_2(y) W_1(x)$

$R_1(y) \rightarrow w_2(y)$

$R_2(x) \rightarrow w_1(x)$

Cyclic

Hence

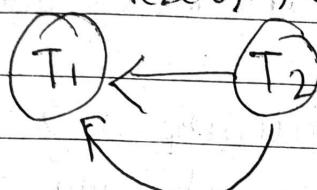

non-conflict

serializable.

Ex-2 $R_1(x)$ $R_2(x)$ $w_2(y)$ $R_1(y)$ $w_1(x)$

\sqcup \sqcup \sqcup

$R_2(x) \rightarrow w_1(x)$

$w_2(y) \rightarrow R_1(y)$

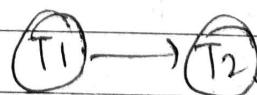

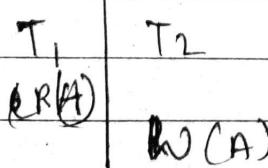

Acylic : conflict serializable

Order: $T_2 : T_1$

Precedence graph method.

node \rightarrow transactions

edges \rightarrow various conflicts

Acylic : conflict serializable

Cyclic : Non-conflict serializable

In case the graph is Acyclic

i) It is conflict serializable

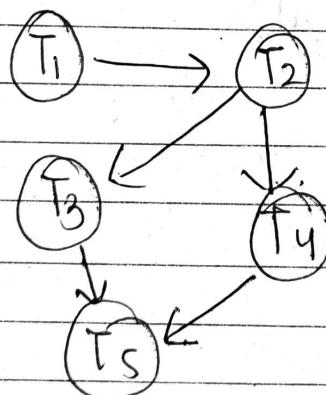

We find the serial execution Order as follows.

1) Remove the node with an Indegree 0 & also remove all the edges corresponding to it

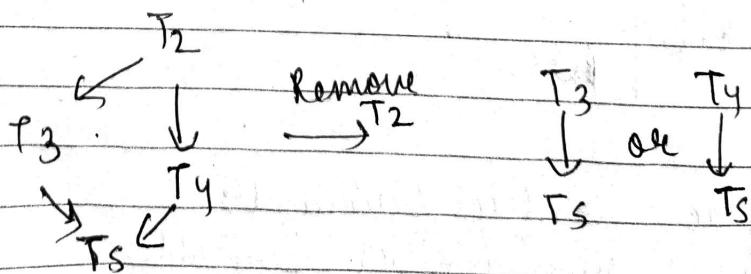

2) Repeat Step 1 till all the Nodes are covered.

3) The final order of execution of transactions, is the order in which the nodes are removed from the graph.

Cycle \rightarrow Non serializable.

Through Conflict we only get to know it is non conflict serializable not non serializable.

View Serializability

Serializability

View serializable : A schedule is said to be view serializable, if it has an equivalent view equivalent schedule.

View equivalent schedule : A schedule S' is said to be view serializable so if it satisfies the following 3 cond'n.

① Initial Read → If $T_1, T_2, T_3 \dots T_j$ transaction perform initial read (i.e. Read the values of data items directly from the database before any modification (write operation) on the data items A, B, C ... J respectively in a schedule S then none of these Initial Reads should be violate in its view equivalent schedule S' .

② Read write sequence - The Read write conflict pairs should be in the same sequence in both the view equivalent schedules.

③ Final update → If T_i is a transaction that updates a data item (X) finally (at the end) in schedule S , then T_i should only update finally the data item X in the view equivalent schedule S .

Ex: S: $R_2(B) \quad w_2(A) \quad R_1(A) \quad R_3(A) \quad W_1(B) \quad w_2(B) \quad w_3$

$w_2(A) R_1(A)$

$T_1 \rightarrow T_2$

$w_1(B) \quad w_2(B)$

T_3

Non conflict serializable

there is
a write
first

	A	B	
Initial Read	X	T_2	$T_2 \rightarrow T_3$
Final update	$\bullet T_2$	T_3	$T_2 \rightarrow T_1 \rightarrow T_3$
Update	T_2	T_1, T_2, T_3	

Order $T_2 \rightarrow T_1 \rightarrow T_3$

View Serializability : A tabular form

T_1 RCA)	T_2	T_3
	R(A)	
$w(A)$		$R(B)$
	$R(C)$	
	$R(C)$	
	$w(B)$	
		$w(C)$

$R_1(A) R_2(A) R_3(B) W(A) R_2(C) R_2(B) W(B)$
 $W(C)$

	A	B	C
Initial	T_1, T_2	T_3, T_2	T_2
read	T_1	T_2	T_3

232113	232113

Check whether view serializable.

S: R₂(B), R₂(A) R₁(A) R₃(A) W₁(B)
W₂(B) W₃(B)

	A	B	
Initial Read	T ₂ , T ₁ , T ₃	T ₂	→ ①
update	X	T ₃ , T ₂ , T ₁	→ ②
final update	X	T ₃	→ ③

Since no transaction
is performing any
write operatn.

By ① & ② & ③

on data item "A"

T₂ → T₁ → T₃

So we can just

ignore the operatn,

on data item A

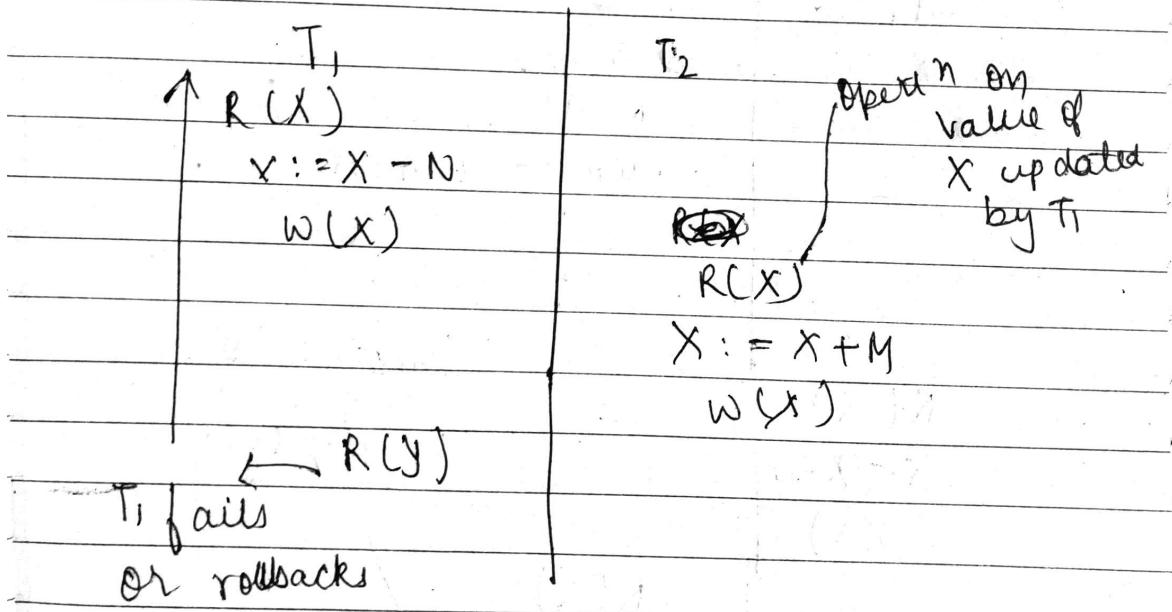

for the time being.

S		S'	
T ₁	T ₂ R ₂ (B) R ₂ (A) R ₁ (A) W ₁ (B)	T ₃ Initial Read.	T ₁
	R ₃ (A)		T ₂ R ₂ (B) R ₂ (A) W ₂ (B)
	W ₂ (B)		R ₁ (A) W ₁ (B)
	W ₃ (B)		R ₃ (A) W ₃ (B)

Q. Check whether the schedule given is view serializable or not.

Dirty Read Problem (W-R problem)

This problem occurs when one transaction updates a database item & then the transaction fails for some reason. Meanwhile, the update item is accessed (read) by another transaction before it is changed back (or roll back) to its original value.

So, update by T_1 was temporary ($w(x)$) & the oper'n's performed by T_2 on this temporary value should now be rollbacked or reversed back.

The Incorrect Summary Problem.

If one transaction is calculating an aggregate summary function on a number of database items while other transactions are updating some of these items, the aggregate function may calculate some values before they updated & others after they are updated. So, the aggregate sum in such a case would contain a wrong value.

T_1	T_2
	Sum := 0 R(A)
	Sum := Sum + A
	:
R(X) $X := X - N$ W(X)	Computes sum using value updated by T_1
	R(X)
	Sum := Sum + X
	R(Y)
	Sum := Sum + Y → Old
R(Y) $Y := Y + N$ W(Y)	New value → Sum has incorrect value.

The Unrepeatable Read Problem

Let's suppose a transaction T reads the same item twice & the item is changed by the another Transaction' betⁿ. the two reads. Hence T receives diffⁿ value for its 2 reads of the same item.

Example: During an airline reservation system, transaction a customer enquires about seat availability on a particular flight, the transaction then reads the no. of seats on that flight a second time before completing a the reservation & it may end up showing a diffⁿ value.

T_1	T_2
$R(X)$	
Both reads have diff ⁿ values of X though T_1 didn't update X	$R(X)$ $W(X)$
$R(X)$	

Page No.	101
Date	1/1/2023

Problems due to concurrent Transaction

- 1) lost update (WW)
- 2) Unrepeatable Read (RW)
- 3) The incorrect summary. (due to oper'n of aggregate functions)
- 4) Dirty Read (WR)
Temporary

Lost update Problem (Some update is lost) (write)

This problem occurs when 2 transactions that access the same database items have their oper'n's interleaved in a way that makes the value of some database item incorrect

T_1	T_2
$X := 100$	
$N = 50$	$R(X)$
$M = 20$	$X := X - N$
	$W(X) = 50$
$X = 50 \leftarrow W(X)$	$R(X)$
J_1	
J_2	$X := X + M$
$y := Y + N$	$X := 120$
$W(Y)$	
$y := Y + N$	$W(X) \rightarrow 120$
$W(Y)$	J_3
$y := Y + N$	$item X$
$W(Y)$	$has an$
	$incorrect$
	$value.$

Page No.	1
Date	

Recoverability

recoverable

Change can be

undo

Previous state

can be restored

Irrecoverable

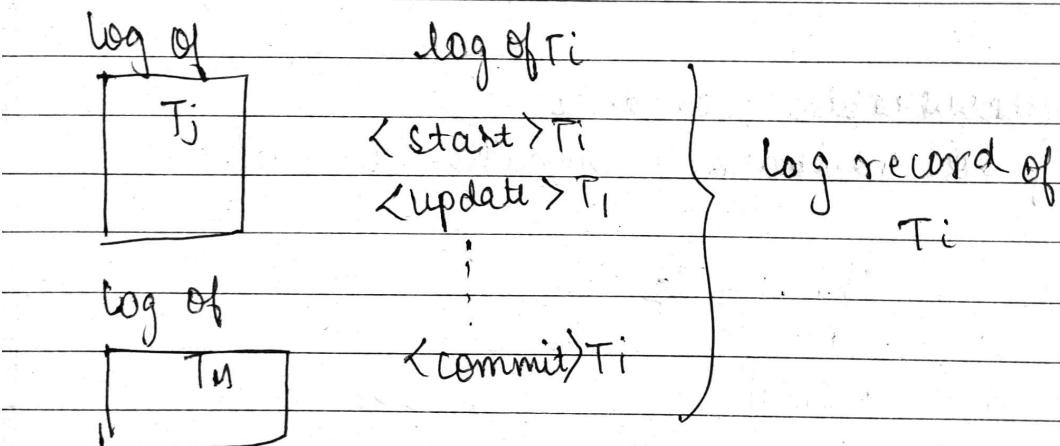

Changes can't be undone

Previous state

can't be restored

Procedures: When a transaction (say T_i) executes, there is always a transaction log created corresponding to it.

Update Example

$\langle T_0, X_j, V_i, V_j \rangle$

$\langle T_0, A, 100, 200 \rangle$

when Roll backs previous value of Ti
is stored.

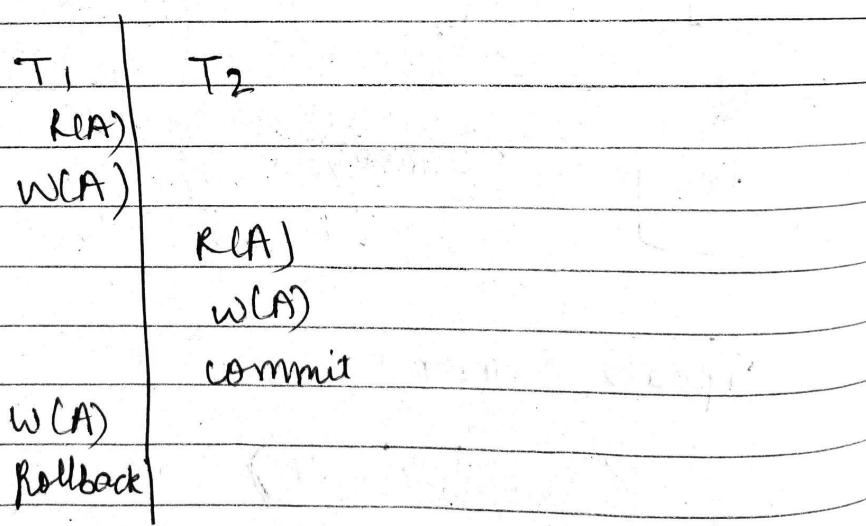

After a commit, there won't be rollback
it makes the schedule recoverable as
the log is deleted after schedule commit.

Schedule On the basis of Recoverability

- 1) Recoverable Schedule.
- 2) Cascading Rollback (Cascading Recoverable)
- 3) Strict Recoverability (Third level of recoverability).

Irrecoverable Schedule

If we rollback a committed transaction

Cascading Rollback \rightarrow It is a type of Rollback when, because of the Rollback of 1 transaction, rollback of many other transactions is caused.

T ₁ W(A)	T ₂ R(A) W(A)	T ₃ R(A) W(A)	T ₄ R(A) W(A)
Rollback			

Rollback of T₁ causes Rollback of all T₂, T₃, T₄.

Solⁿ \rightarrow Transaction which completes first should commit first

T ₁ W(A) commit	T ₂ R(A) W(A) commit	T ₃ R(A) W(A) commit	T ₄ R(A) W(A) commit

forgetful witness

Disadvantage \rightarrow unnecessary wastage of CPU time.

Problem of (WR) has been removed

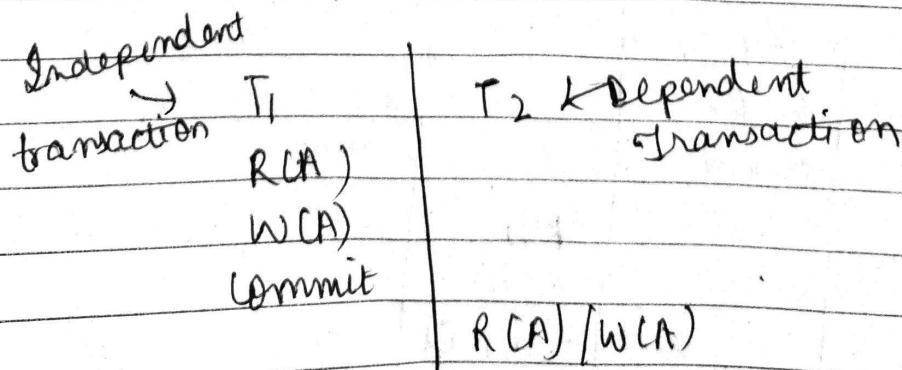

Remaining problem

\downarrow
R W
 \downarrow
W W

Shortcut \rightarrow To check if a scheduling is Cascading Recoverable.

1) Check for WR condⁿ, If no WR problem exists, it is cascading recoverable schedule.

3) Strict Recoverability.
The dependent transaction should ~~be~~ ^{read} or write only after the commit of the Independent Transaction T_1 here.

Time	1	2	3	4	5
T ₁	R				
T ₂		W			

so T₂ show R/W only after T₁.

Advantages

→ WW also remove as well as WR.

→ R-W still left

Types of schedule

Recoverable

Unrecoverable

Cascading recoverable (level 0)

Cascadeless recoverable (level 1)

Strict recoverable (level 2)

Cascading Rollback → When rollback of 1 transaction causes the rollback of some other transactions, then the phenomena is called as Cascading Rollback.

Imp Note → All transactions haven't performed their rollback.

→ The phenomena of Cascading Rollback occurs in some recoverable schedules where an uncommitted transaction has to rolled back because it Read an item from a transaction that failed.

Cascadeless schedule

A schedule is said to be cascadeless, if every transaction in the schedule reads only item that were written by committing transactions.

For:	T ₁	T ₂	T ₃	T ₄
	W(A)			
		R(A)		
		W(A)		
			R(A)	
			W(A)	
	T ₁ Abort			R(A)
				W(A)

T ₁	T ₂
R(A)	
W(A)	
Commit	
Rollback	R(A)

The problem of (RW) Dirty Read is removed.

Check if ~~not~~ cascadeless Recoverable/Irrecoverable.

(WR)

$R_1(x) R_2(z) R_1(z) R_3(x) R_3(y) W_1(x) W_3(y) R_2(y)$
 $W_2(z)$

Step 1

Step 1 → Checking if Recoverable/ Irrecoverable transactions are committing in the same order as they are completing their work.

Step 2: → Check if RW problem is there.

$W_3(y) R_2(y)$, therefore it is not cascadeless recoverable.

Strict schedule → cascadeless

Cascadeless schedule → recoverable.

Check for strict Recoverability

$R_1(x) R_2(z) R_3(x) R_1(z) R_2(y) R_3(y) W_1(x)$
~~W_2(z) W_3(y) W_2(y) C_3 C_2~~

1) Level of completion | Commit there
