L-1.1

Introduction to OS and its function

Operating System :- It is a system software which works as an interface between users and hardware.

Eg: Windows, Macintosh (Mac), Linux

Primary goal → To provide convenience to user.

Throughput → no of tasks executed per unit time. Eg - Linux

Functionality of Operating System

- 1) Resource management (kis user ka kitne particular time ke liye hardware ko provide kusane hai).

Date: / /

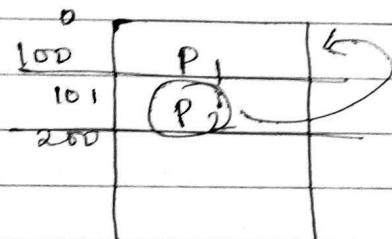

2. Process management - Managing & Executing multiple process at a time. we use CPU scheduling

program execute process

3. Storage management \rightarrow How to store the data permanently using file system.
Eg - Hardisk.

4. Memory management (RAM) \rightarrow RAM is limited in system. Every process before execution comes to RAM. Allocation & deallocation takes place.

5. Security and privacy - (Password protection)
Windows uses two security protocol.

It provides security b/w the process also.

Windows (cmd)
Linux (Terminal)

OS works only through system calls
(Read, open, write)

L-1.2

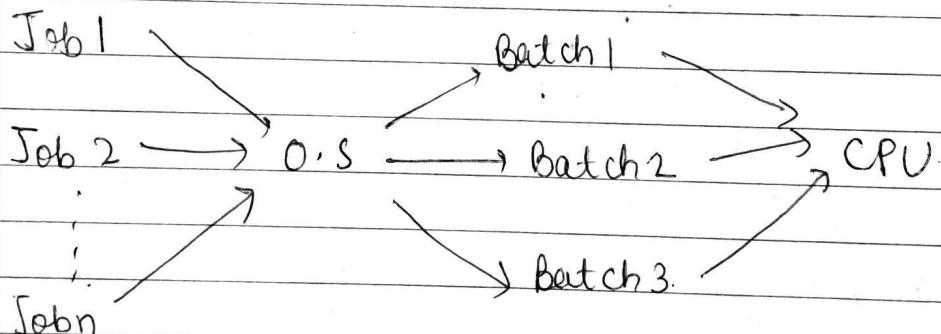

Batch Operating System.

Types of Operating System

- 1) Batch OS.
- 2) Multiprogramming OS.
- 3) Multitasking OS / Time sharing
- 4) Real time OS
- 5) Distributed OS
- 6) Clustered OS
- 7) Embedded OS.

1) Batch OS

Similar (Batch) kind of jobs.

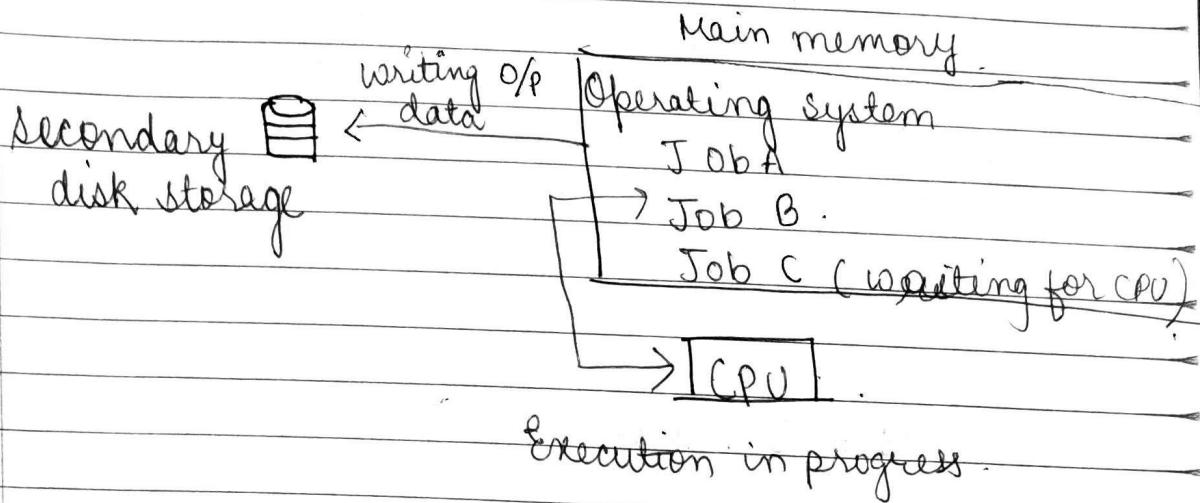

Same type of Jobs batch together and execute at a time.

Demerit: It processes one job at a time till the time CPU remains idle.

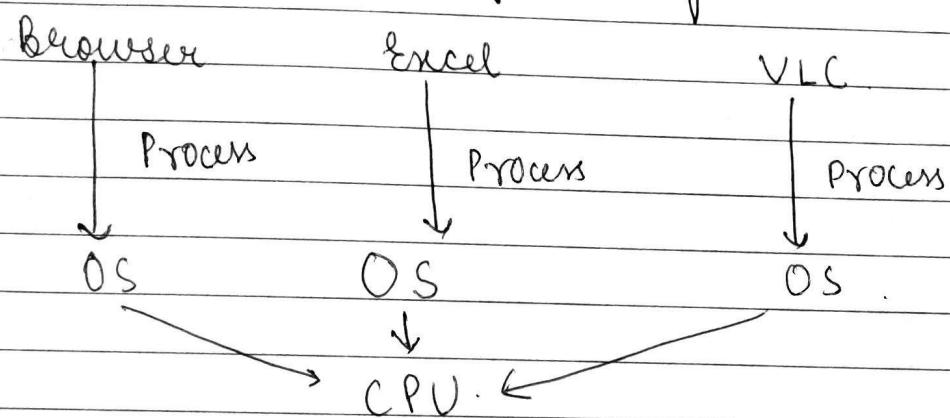

L-1.3 (Multiprogramming & Multitasking system)

Execution in progress.

Multiprogramming OS / Time sharing

Multitasking OS

Multiprogramming OS.

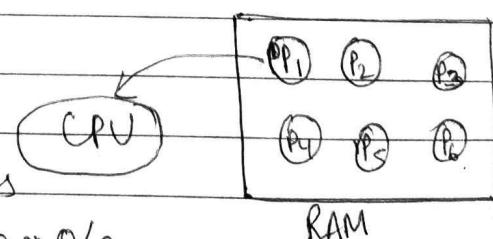

Non preemptive

CPU executes a process

completely until or unless

process demands any I/O or O/P operation.

Idle time should be removed

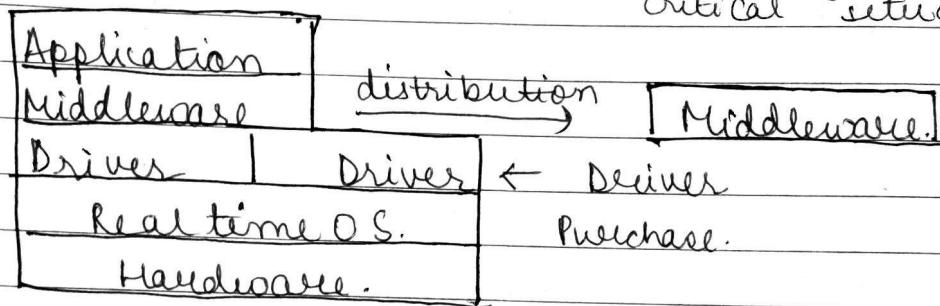

Multitasking / Time sharing - Provides particular time for every process. If its complete its great but if not it moves to other process P₂ & schedule P₁ for further.

Response time is reduced for every process. Idleness is not there for CPU job.

Dec 1.4 Types of OS (Real time)

Real time OS → Hard (Restriction on time is more)

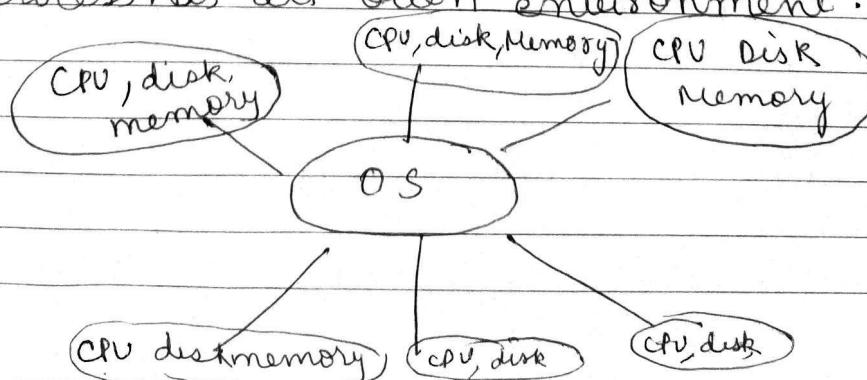

→ soft Eg - In gaming no critical situation

Immediate output

- i) No delays

Distributed → Processing environment is distributed all over the world. Every process has its own environment.

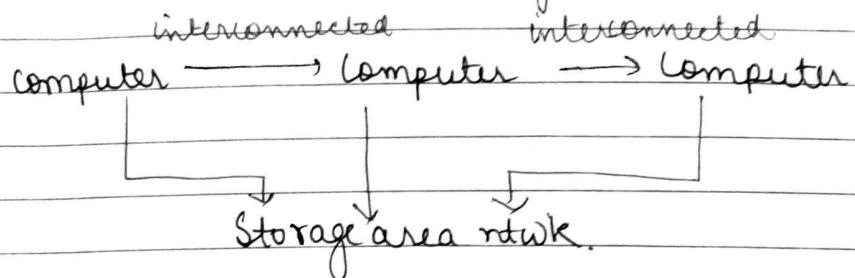

It uses multiple central processors to serve multiple real-time applications & multiple users using telephone wires.

Clustered OS. → ~~theles~~ Clustered OS share storage and are closely linked via LAN or a faster interconnection.

Group of connected computer

* fault tolerance, scalability

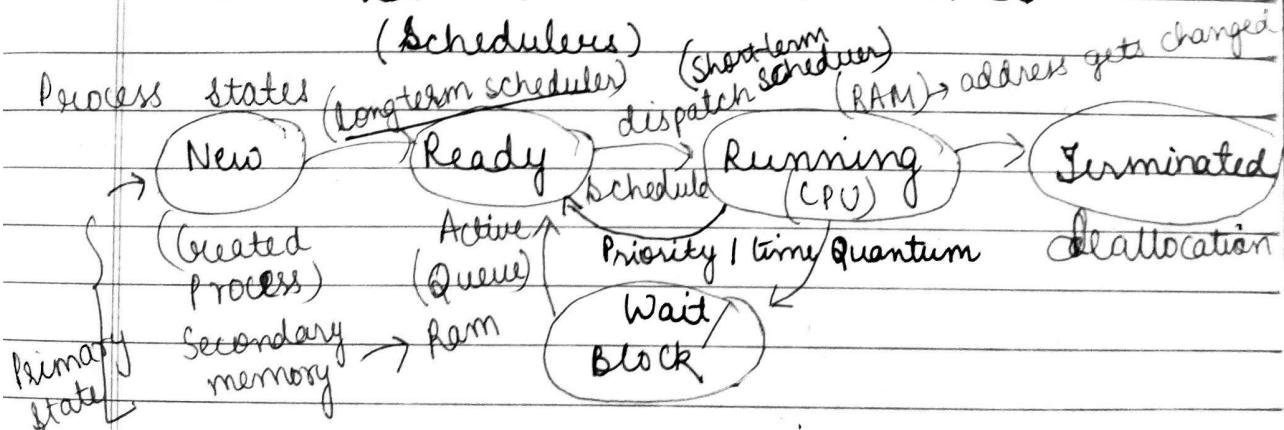

Embedded OS - It is a special purpose computer designed to perform one or few dedicated fun'n's. with real time computing. Works on a fixed functionality.

CPU

I/O → Processor → O/P

lec - 1.5 Process states in OS

long term scheduler - Bring more & more process in ready state.

LTS - long term scheduler

STS - short term scheduler.

Non preemptive.

Preemptive.

Non preemptive - Running process isn't stopped at middle of process.

Preemptive - Running process stopped at middle of process.

Syllabus of OS.

1. Basic Introduction : what is O/S, goals, need, system calls, diff' n os.
2. Process Mng : what is process, Algo - FIFO, SJF, Preemptive, Non preemptive, Round Robin
3. Deadlock - Banker Algo
4. Concurrency control - Semaphore, msg passing, race cond'n.
5. Memory - Paging, Segmentation, Fragmentation virtual memory, Page Replacement.
6. Disk Mng - C-look, Algo, PCFS, SSCF, look
7. File mng : NIFS, FAT 32, Seg., Random
8. Unix System : commands
9. Case study : MSDOS
10. Security - Attacks, firewalls, exceptions

L-1.1

Operating system acts as an interface between user and hardware. If there is no OS user has to write a program to interact with hardware.

Primary goal - Its primary goal is to provide convenience to the user.

user users user

Applications

Operating System

Hardware

CPU I/O devices Ram

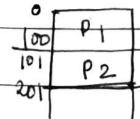

Throughput - No of tasks executed per unit time.

Eg - Linux

Functionalities of OS.

- i) Resource management - In case of multi-user managing, OS acts as key to provide hardware among the users for a given time. When many users are sending request at a time so we use OS so that there is no load on system.

2. Storage / Process management \rightarrow Performing multiple process at a time, OS uses CPU scheduling algorithms for processing & executing in a proper & efficient way
3. Storage management (Hard disk) - How to store data in hardisk using file system management is done by OS.
4. Memory management (RAM) - In RAM we have limited no of size. Every process which gets executed goes in RAM there is allocation & deallocation done by OS in RAM after the process is done.

5. Security & privacy
It provides security & privacy between the process such that it doesn't get blocked. Password protection

Windows (cmd) } system calls
Linux (terminal) } (Read, open, write)

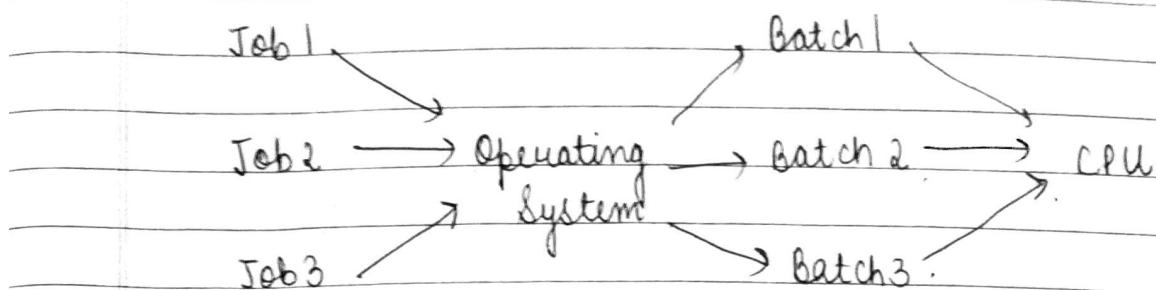

1.2.

Types of OS

- 1) Batch OS
 - 2) Multiprogramming
 - 3) Multitasking
 - 4) Real time OS
 - 5) Distributed
 - 6) Clustered
- f) Embedded

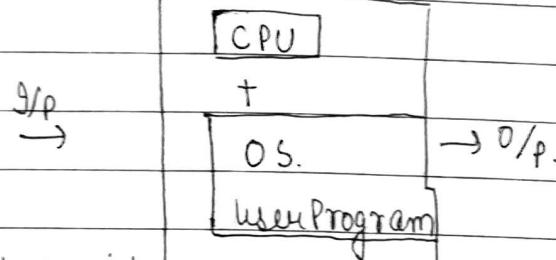

1) Batch OS

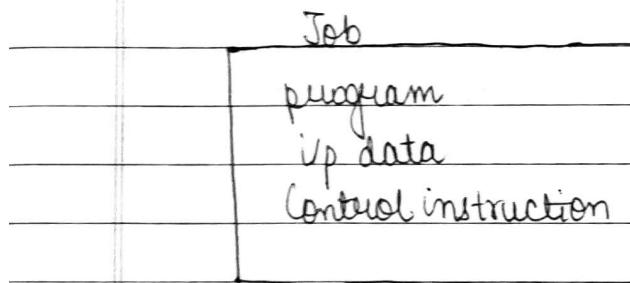

~~mainframe~~

before batch OS, we used mainframe computers

- 1) Common I/O & O/P devices were card readers & tape drives.

- 2) User prepare a job which consist of the program I/O data & control instructions.

- 3) I/O ~~Punch~~ O/P (Punch card)

Major problem was:

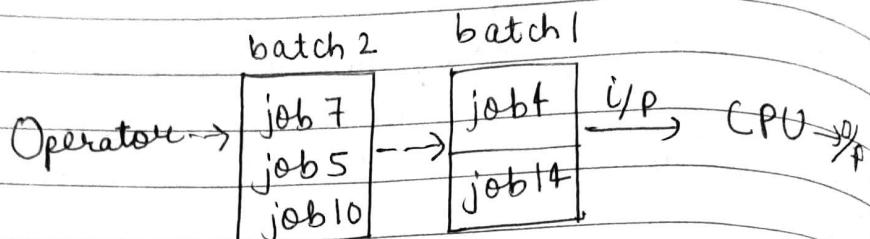

- 1) Speed mismatch (user & CPU)
- 2) less memory
- 3) every job has diffⁿ req^m

1. Batch processing (e.g.: payroll system)

User1 → job1

User2 → job2

Usern → job3.

- 1) Jobs with similar needs are batched together and executed through the processor as a group
- 2) Operator sorts job as a deck of punch cards in a batch with similar needs.
e.g - FORTAN batch, COBOL batch etc.
- 3) first jobs → batch (with same → CPU req.)

Advantages

- 1) In batch job execute one after another saving time for activities like loading compiler.
- 2) During a batch execution no manual intervention is needed.

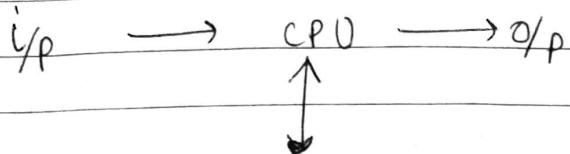

Disadvantage

- 1) Memory limitation
- 2) Interaction of i/p & o/p devices directly with CPU.
- 3) CPU remains idle during loading & unloading

Spooling (Simultaneous peripheral device)

I/p or O/p

Secondary Storage.

temporarily process is storage in secondary storage.

Advantages

- 1) Increase the system performance.
- 2) Spooling resolve the problem of speed mismatch of diff' n. device
- 3) % of one job is overlapped with the computation of other jobs.
- 4) Spooling use the disk as a huge buffer.

Spooling

uses the hard disk as a large spool
(spool is a temporary storage area in hard disk)

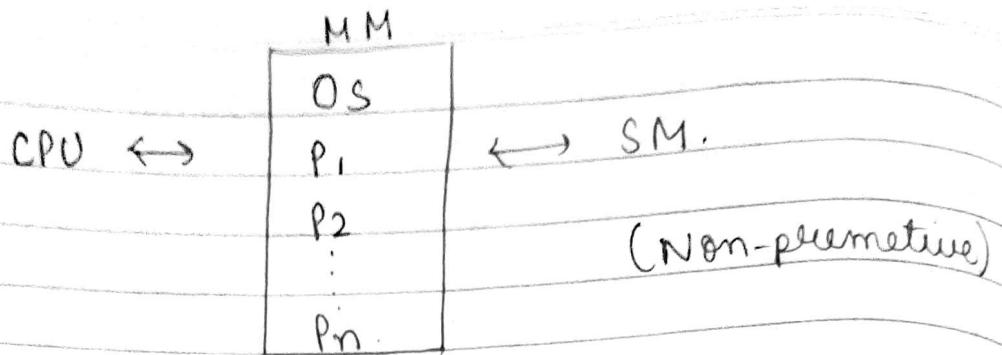

Buffering

uses limited memory space in RAM usually called buffer
(Buffer is a temporary storage area in RAM)

1.3

2.

Multiprogramming O.S

- 1) Maximize CPU utilization
- 2) Multiprogramming means more than one process in main memory which are ready to execute.
- 3) Process generally requires CPU time & I/O time. So if running process perform I/O or some other event which don't require CPU then instead of sitting idle, CPU makes context switch & pick some other process & this idea will continue.
- 4) CPU never ^{remains} idle unless there is no process ready to execute or at the time of context switch

Advantage

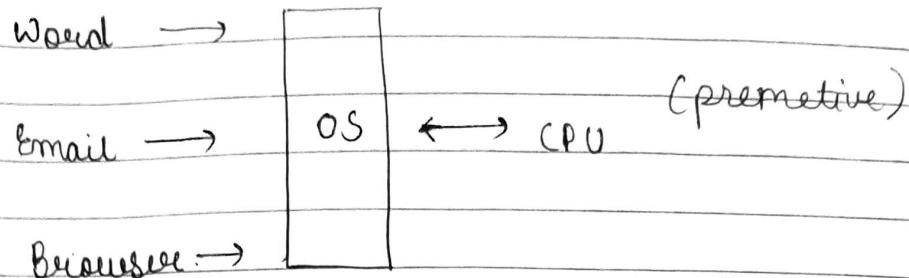

- 1) High CPU utilization.
- 2) less waiting time, response time etc
- 3) May be executed to multiple users
- 4) Now a days useful when load is more

Disadvantage

- 1) Difficult scheduling
- 2) Main memory management is required
- 3) Memory fragmentation
- 4) Paging (non contiguous memory allocation)

3. Multi-tasking OS. (e.g Unix)

Time sharing / Fair share / R.R

1. Multitasking is multiprogramming with time sharing
 2. Only one CPU but switches bet'n process so quickly that it gives illusion that all executing at same time.
 3. the task in multiprogramming may refer to multiple threads of the same program.
 4. Main idea is better response time & executing multiple process together.
4. Real-time OS - It is used in environment where a large no of events mostly external to system must be accepted & processed in a short time within certain deadlines. The time interval required to process & response to input is very small.
Hard RTOS - It guarantees critical task to be completed within a range of time.
Eg - A robot need to weld a car body
- Soft RTOS - It provides some relaxation in time.

Advantages

- 1) Max^{m.} utilization of devices & system
- 2) Better task shifting
- 3) Systems are error free

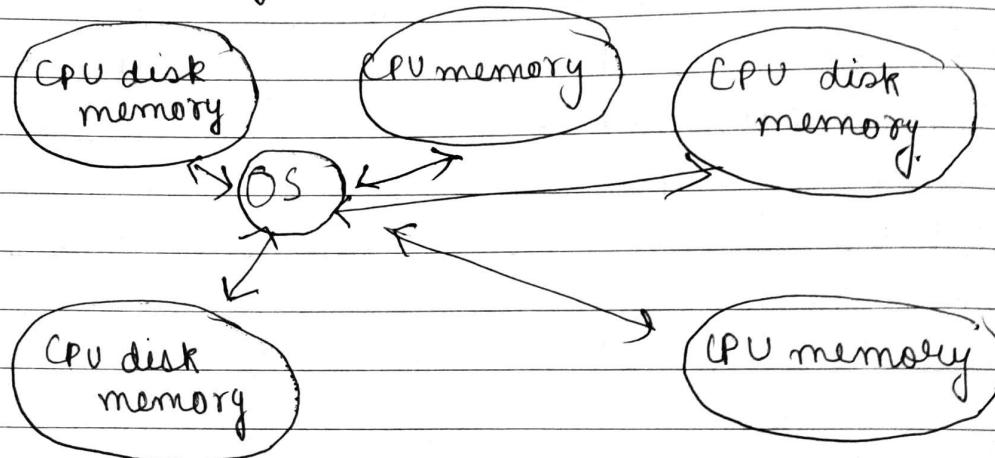

Disadvantages

- 1) limited tasks
- 2) complex algorithms
- 3) use heavy system resources

5) distributed OS. (Eg - LOCUS)

Distributed system uses multiple central processors to serve multiple real time application & multiple users. Data processing jobs are distributed among the processors accordingly.

Processors communicate with each other through various communication lines (such as high speed buses or telephone lines). These are referred as loosely coupled systems or distributed system.

Advantages

- 1) Failure of one ntwk connection doesn't affect other
- 2) Delay in data processing reduces

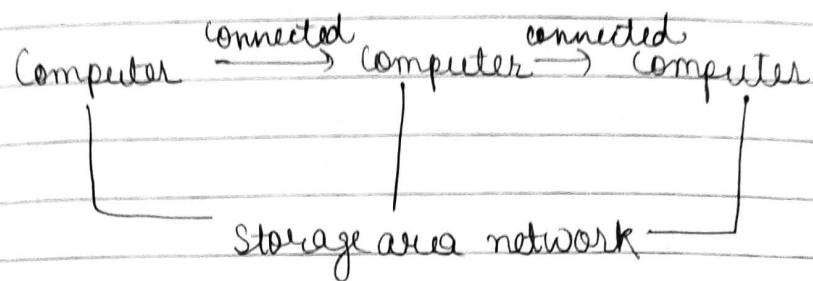

Disadvantages

- 1) Failure of main network will stop entire communication.

b) Clustered OS

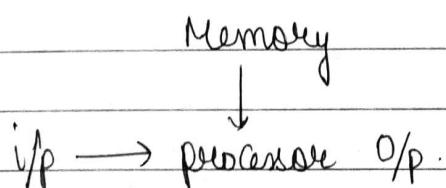

- 1) Clustered computers share storage & are closely linked via LAN or faster connection.

- 2) Comb'n of multiprocessor + distributed OS

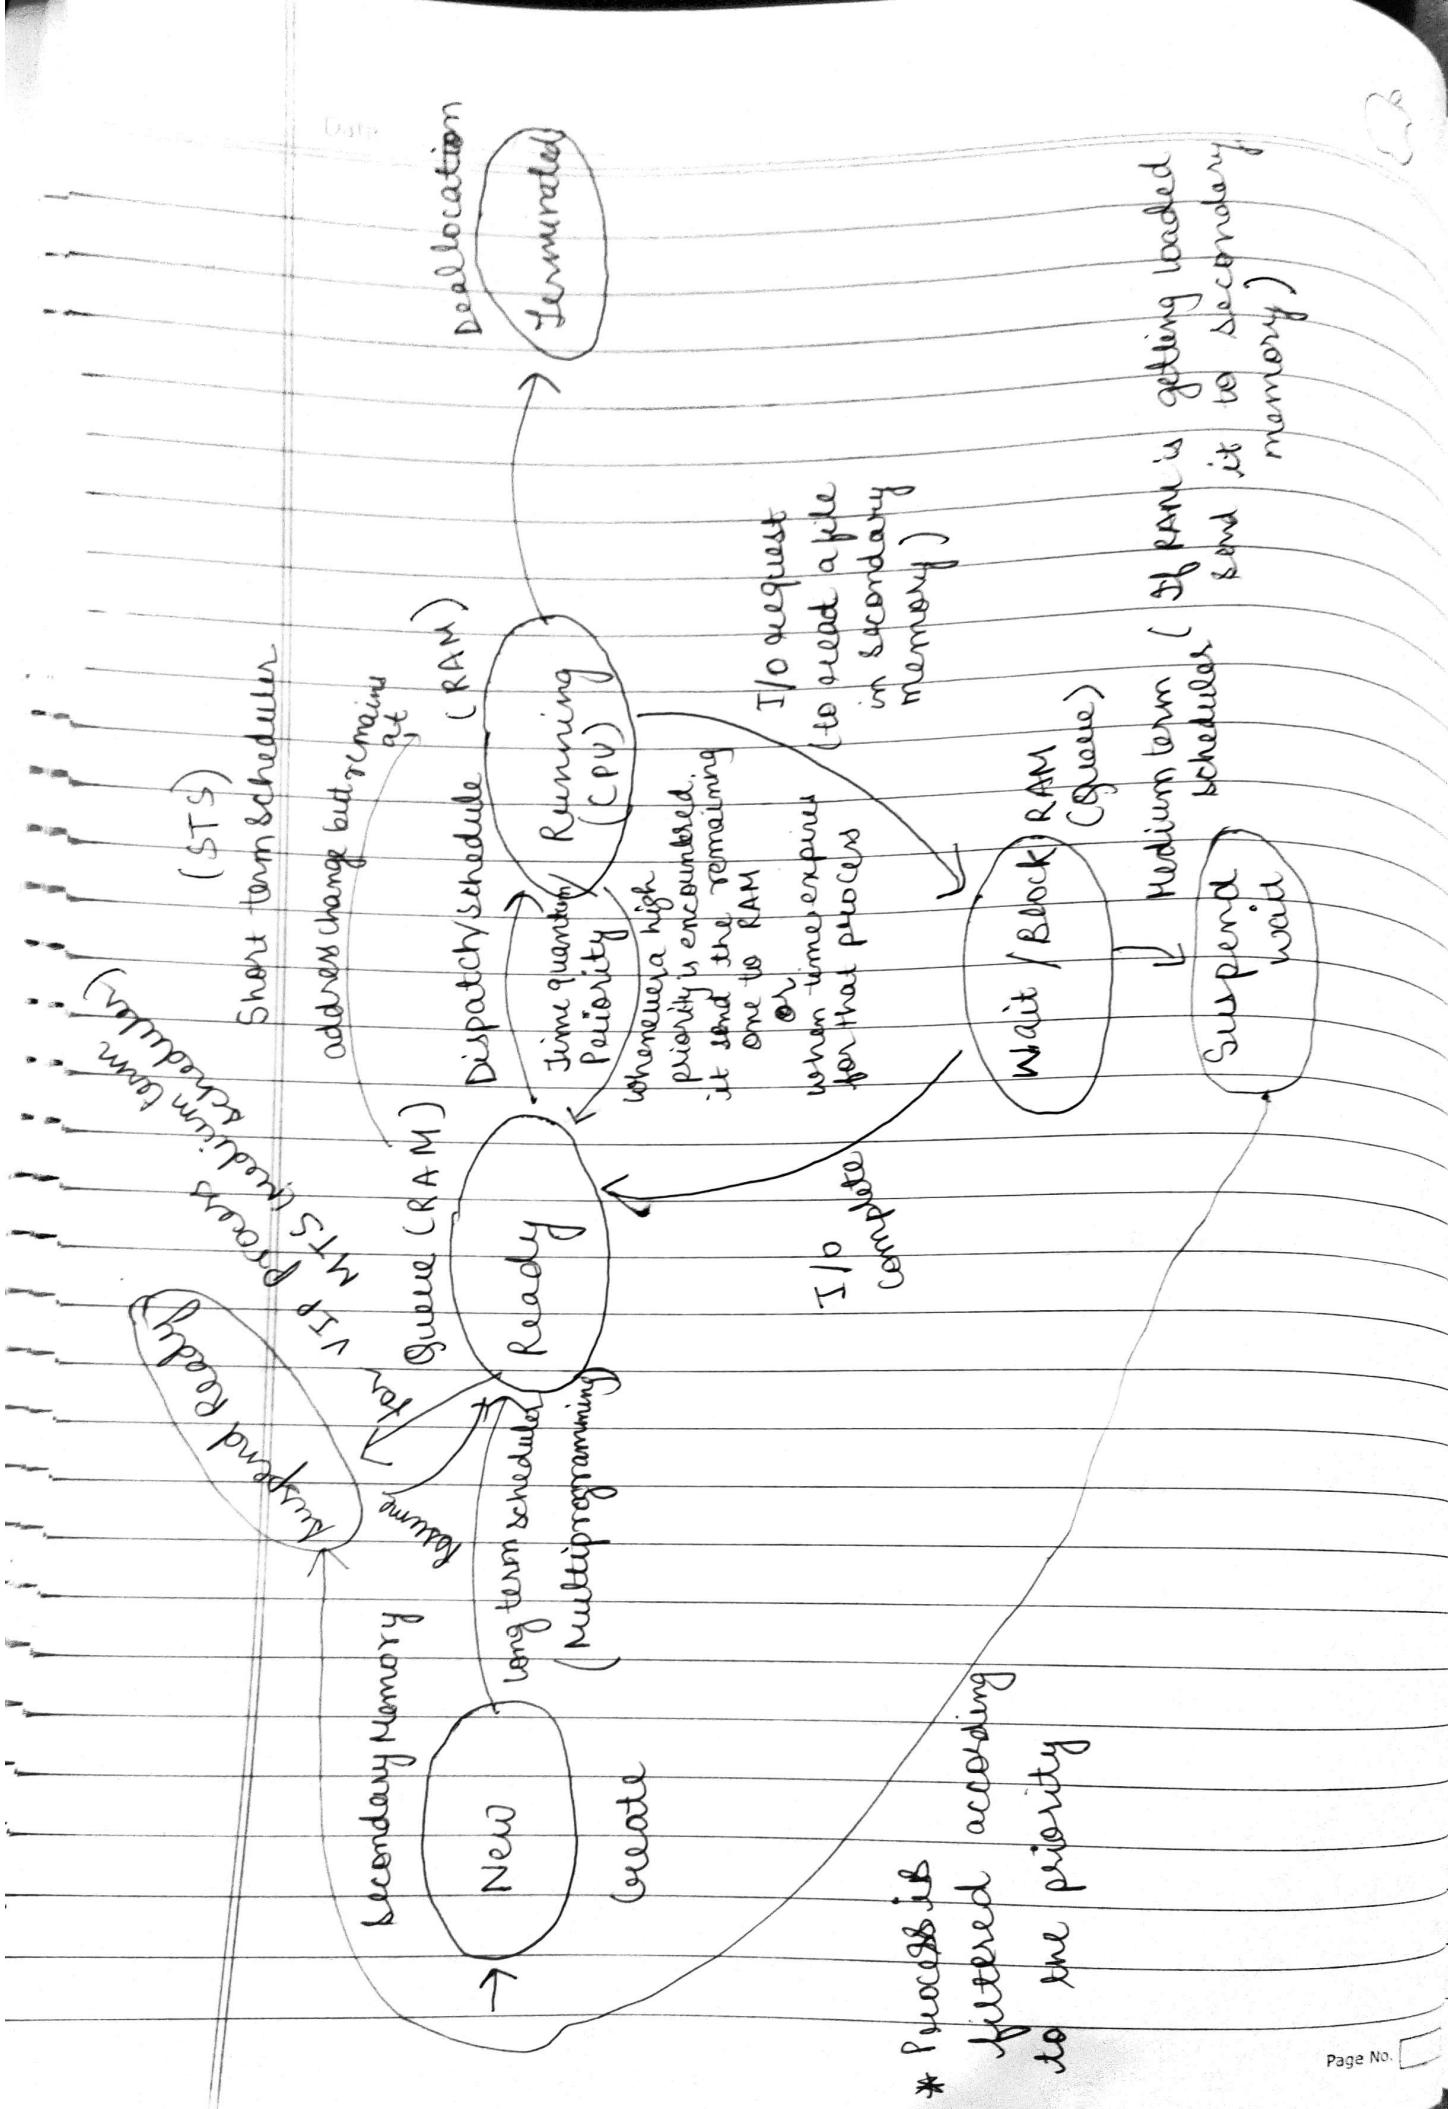

f) Embedded OS. - An OS in which we work on embedded systems. It is designed to perform a specific task for a device that is not in computer.

Eg - ATM

1.5
Process states in OS

- * Non preemptive - NO time quantum, no process can jump in between
- * preemptive - We stop the running process in midway due to high priority process.

L-1.6 Linux Commands.

Q. which command is used to assign only Read permission to all three categories of file 'note'.

- chmod a-~~rwx~~ rwx
- chmod go+r u note
- ~~chmodugo = g+note~~
- chmod. u+r, g+r, o-x note

chmod - change mode

u w x	u w	u w x
u w x	u w	u w x
user	group	other

u - user
g - group
o - others

rx	rw	r - read	4
6	7	w - write	2
		x - execute	1

Q. 'chmod ugo+rwx note' command can be represented in Octal notation as

- 1) chmod 555 note
 2) chmod 666 note
 3) chmod 333 note
 4) chmod 444 note

$$r+w = 4+2 = 6.$$

Q. Suppose you have a file "f" whose contents are

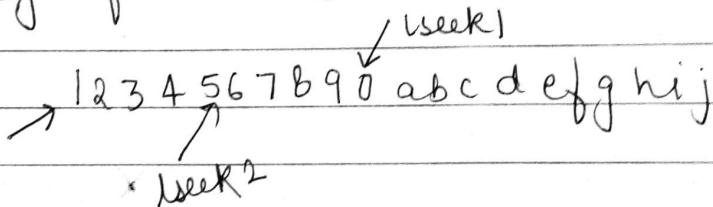

1 2 3 4 5 6 7 8 9 0 abcdefghij
 *seek is used 2 times sequentially.

lseek (n, 10, SEEK_CVR);
 lseek (n, 5, SEEK_SET);

n is file descriptor. After applying seek q times, what will be the current position of R/W head?
 (Index starts from 0)

- a) 0.
 b) 5
 c) 10
 d) 15.

lseek - system call (To move read write head we use lseek command)
 by default read write head is at 0.

10, Seek_cvr → move to the given no from the current

5, Seek_set → set the current pos at given

-2, Seek_end → Count from the end towards left.

L-1.7

System calls in OS.

User mode System call Kernel mode

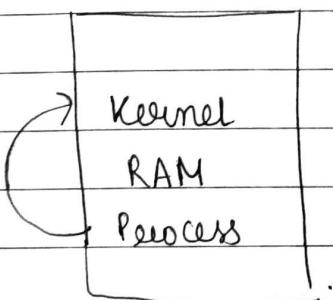

2+4 monitor, print(6)

In Linux we can use system call directly.

printf() → accessing system call

System calls.

- 1) file related SC → open(), Read(), write(), close()
create file etc.

Program

- 2) Device related → read, write, reposition
ioctl(i/p o/p control), fcntl(file related control)

for hardware devices

- 3) Information → Process or regarding device attributes

For e.g.: - getpid, attributes, get system time & data.

4) Process control \rightarrow Program being loaded
 \rightarrow load, execute, abort, fork, wait,
 signal, allocate etc.

5) Communication Control - Interprocess
 communication

\rightarrow pipe(), create/delete connections, shmat()

L-1.8

Fork system call

To create a child process from parent process
 we can use fork() or thread.

fork()
 0 child process
 +1 parent process
 -1 child process not created

```
main() {
    fork();
    printf("hello");
}
```

Parent process

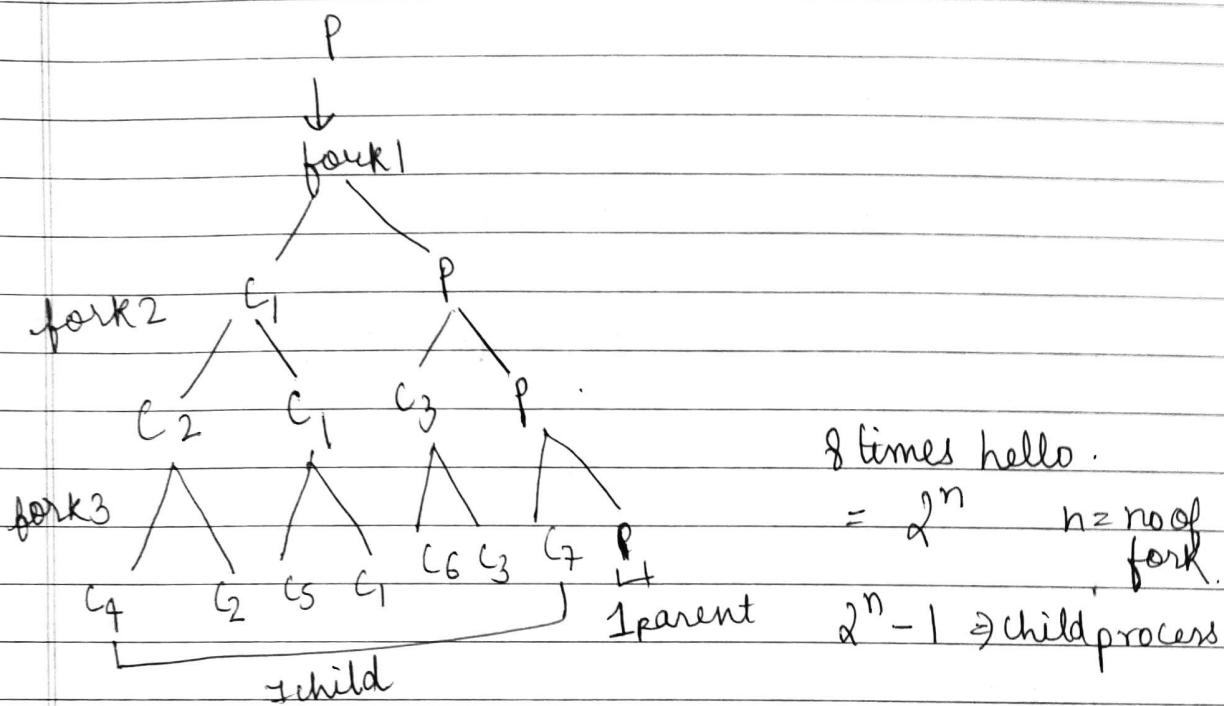

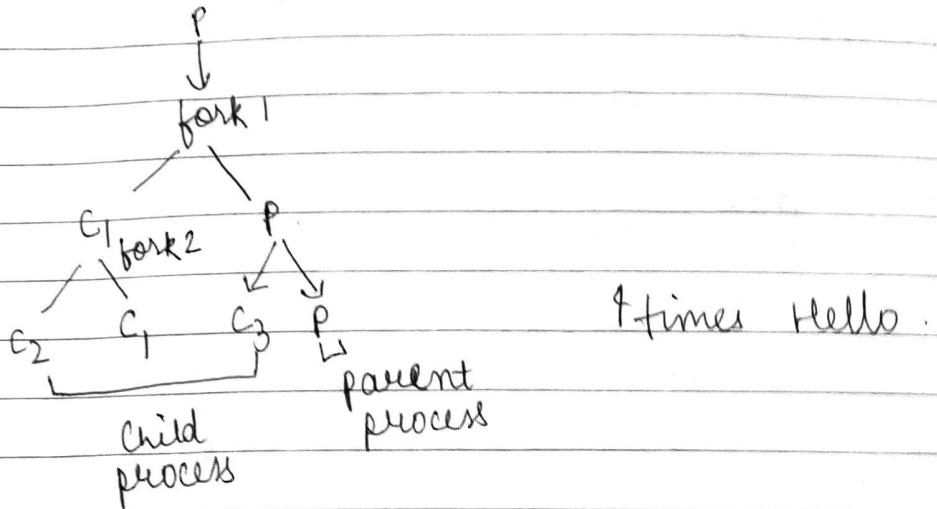

fork

0 Child process +ve Parent process

↓ hello

↓ hello

```
main() {
    fork();
    fork();
    printf("hello");
}
```

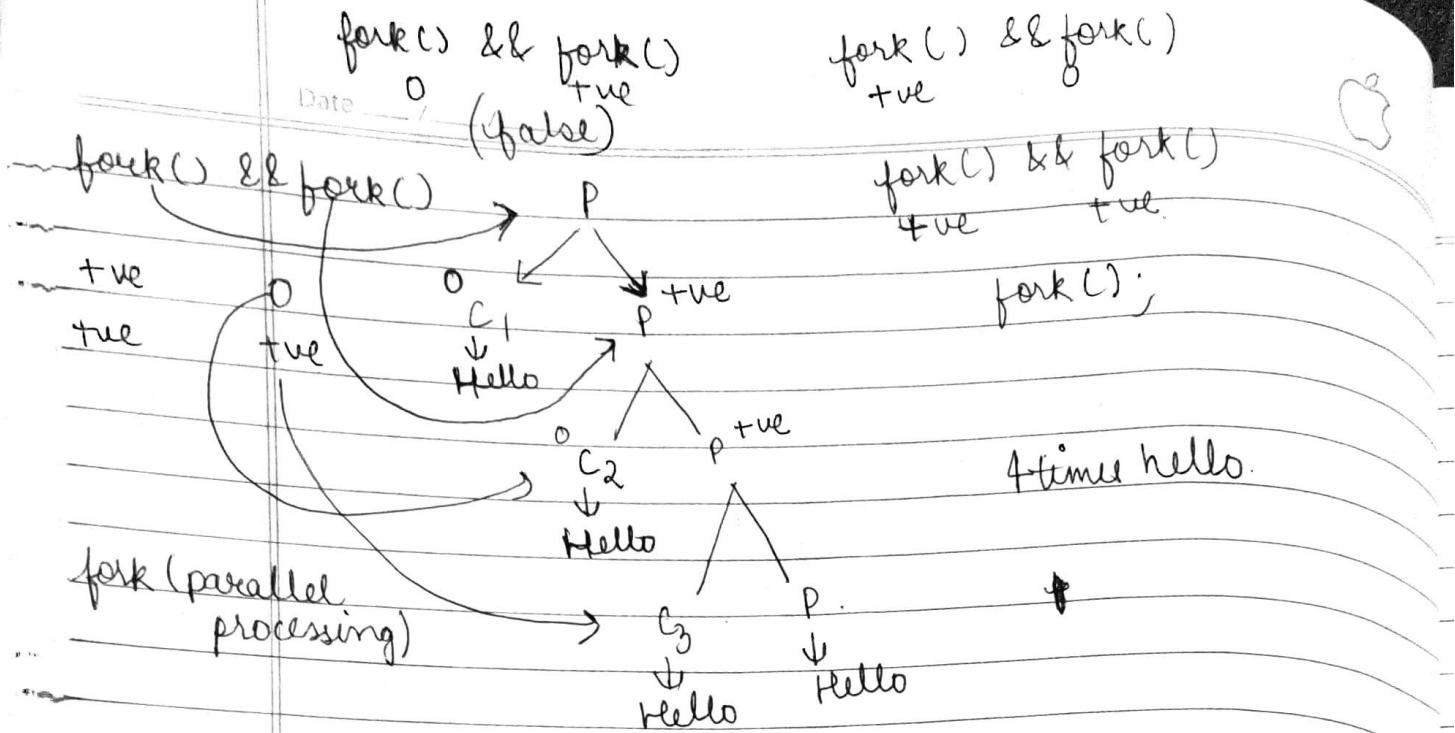

L-1.9

Questions on Fork System Call

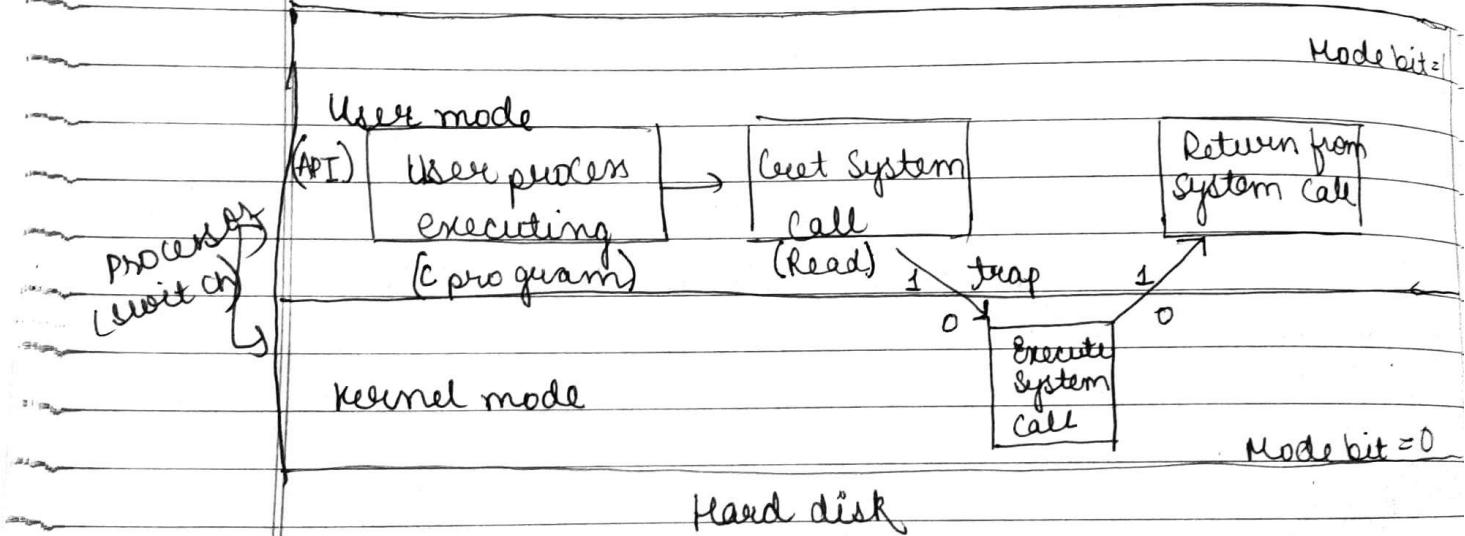

```
# include <stdio.h>
# include <unistd.h>
```

```
int main ()
{
    if (fork() & fork())
        fork();
    printf ("Hello");
    return 0;
}
```

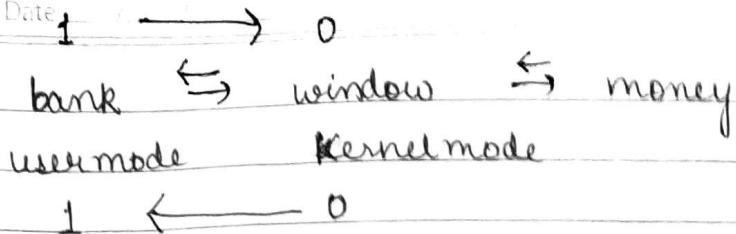

L-1.10 .

Kernel is the central component of an OS that manages operations of computer and hardware. It basically manages operⁿ.s of memory & CPU time

Date

L-1.11

Process Vs Threads in OS

Process - It is a heavy weight task] multitasking

Thread - It is a light weight task] environment

Process

- 1) System calls involved
- 2) OS treats diffⁿ process differently.
- 3) Diffⁿ process have diffⁿ copies of data, files, cache
- 4) Context switching is slow
- 5) Blocking a process-not block other
- 6) Independent

Thread (User level)

- 1) No system call involved
- 2) All user level threads treated as single task for OS.
- 3) Threads share same copy of code
- 4) Context switch is fast
- 5) Blocking a thread - block entire process
- 6) Interdependent

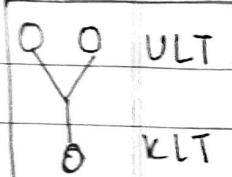

Code
Data

Stack
Code
Data

fork()

T ₁	T ₂
Stack 1	Stack 2
Code	
Data	

Hybrid environment

L-1.12

User level & kernel level thread
code & data is shared
have own stack but

User level thread

- 1) User level thread are managed by user level library.

- 2) User level threads are typically fast

- 3) Context switching is faster.

- 4) If one user level thread perform blocking operation then entire process get blocked

(context switch) Process \rightarrow KLT \rightarrow ULT

kernel level thread

- 1) Kernel level threads are managed by OS (system calls)

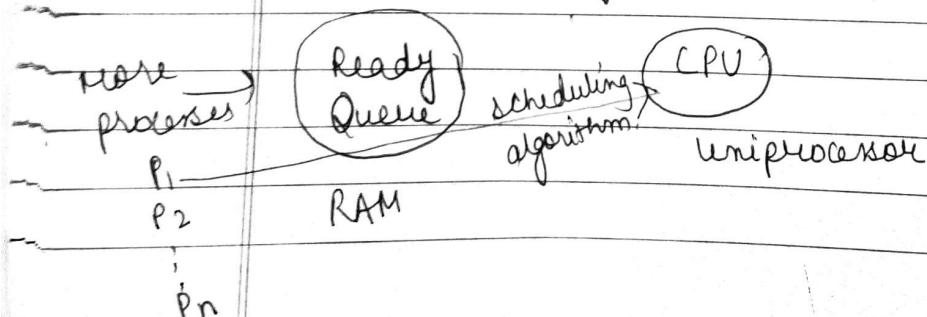

- 2) Kernel level threads are slower than user level

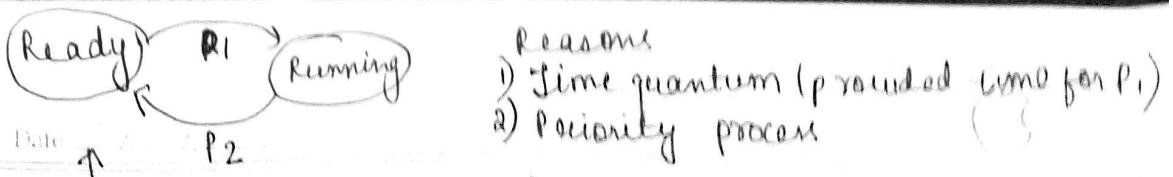

- 3) Context switching is slower.

- 4) If one kernel level thread blocked no affect on others.

L - 2.1 Process scheduling Algorithms

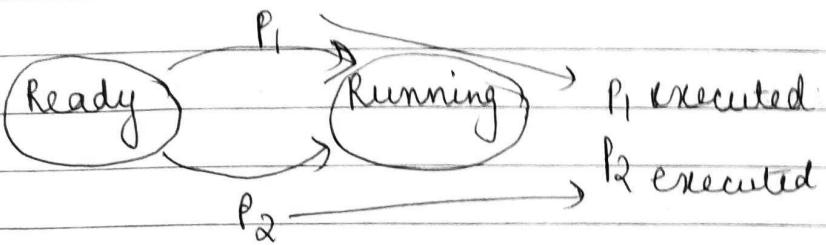

A way of selecting an algorithm from ready queue & putting it on the CPU.

- * Preemptive → If a process is taken out from ready queue off RAM and is put in running process (queue)(CPU). Then we can stop the process P₁ & give another process p₂ & send p₁ to ready queue. It provides responsiveness.

- * Non preemptive → If a process is taken out from ready queue it would be processed till its burst time, after then only new process can be introduced.

Scheduling Algorithms

Preemptive

Non preemptive

BT

burst
time

Priority given

4) HRRN (High response ratio next).

5) Multilevel Queue

6) Priority based

L = 2.2

Different times in CPU scheduling

Arrival time - The time at which processes enter the ready Queue or stack

Burst time - Time required by a process to get executed on CPU.

Completion time - The time at which process completes its execution

~~Two seconds - time - Completion - Arrival time~~

Waiting time - Turnaround - Burst time

Response time - (The time at which process get CPU) -
(Arrival time))

```

graph LR
    A[Arrival time  
(point of time)] --> B[process  
execution  
duration]
    B --> C[Completion time  
(point of time)]
  
```

Arrived Bank → Create new → deft Bank account.

L-2-3

first come first serve (FCFS)

FCFS is an OS scheduling algorithm that automatically executes queued requests and processes in order of their arrival.

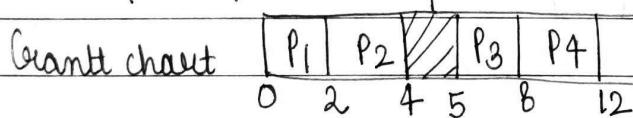

- i) The processes which requests the CPU first get the CPU allocation first.
- ii) Managed using FIFO queue.

Process No Kb/milli	AT	BT	CT	TAT	WT	RT
	Arrival time	Burst time	Completion time	(CT-AT)	(TAT-BT)	
0 P ₁	0	2	2	2	0	0
2 P ₂	1	2	4	3	1	1
5 P ₃	5	3	8	3	0	0
8 P ₄	6	4	12	6	2	2

Order of arrival time

Mode : Non pre-emptive

cpu idle

Time →

At t=12, all the processes got executed

$$\text{Avg TAT} = \frac{14}{4}$$

$$\text{Avg WAT} = \frac{3}{4}$$

SJF - (Shortest Job first) \rightarrow ~~JIF~~ SJF

is an algorithm in which the process having the smallest execution time is chosen for next execution.

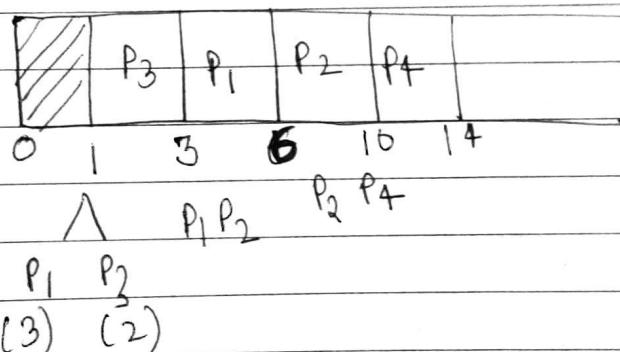

- ii) It can be preemptive or non-preemptive
- iii) It reduces the waiting time for other process.
- w) It is a greedy Algo.

No. Served	Process No	AT	BT	CT	TAT	WT	RT
3	P ₁	1	3	6	5.	2.	0.2
6	P ₂	2	4	10	8.	4.	4
1	P ₃	1	2	3	2	0	0
10	P ₄	4	4	14	10	6	6

Criteria - Burst time

Node - Non-preemptive

Gantt chart

when BT is same see the one having less arrival time else can use process id.

L-2.5

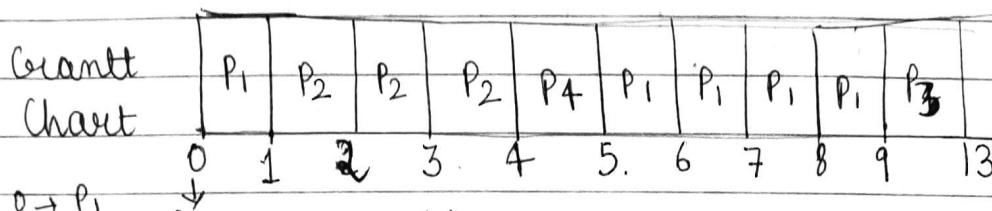

Shortest Remaining Time First
 ↓

(shortest job first + pre-emptive)

Process no	AT	BT	Compt	TAT	WT	RT	CPU first time
P ₁	0	3 5 4	9	9	4	0	0
× P ₂	1	1 3 2	4	3.	0.	0	1
P ₃	2	4	13	11	7	.7	9
× P ₄	4	8	5	1	0	0	7

Criteria : "Burst time"

Mode : "Pre-emptive"

Time →

0 → P₁

1 → P₁, P₂

2 → P₁, P₂, P₃

3 → P₁, P₂, P₃

4 → P₁, P₃, P₄

5 → P₁, P₃

6 → P₁, P₃

7 → P₁, P₃

8 → P₁, P₃

9 → P₁, P₃

$$\text{Avg TAT} = \frac{24}{4} = 6$$

$$\text{Avg WT} = \frac{11}{4} = 2.75$$

$$\text{Avg RT} = \frac{7}{4} = 1.75$$

P₁ → 8 4

P₂ → 3 2 1 0

L-2.7

Round Robin Scheduling Algo.

Round robin is preemptive process scheduling algorithm. Each process is provided a fix time to execute, it is called quantum. Once a process is executed for a given time period, it is pre-empted & other process executes for a given time period.

Process no	AT	BT	CT	TAT	WT	RT	cpu first time
P ₁	0	8.31	12	12	7	0	0:
→ P ₂	1	0.42	11	10.	6	1	2.
→ P ₃	2	2.0	6	4	2	2	4
P ₄	4	1	9	5.	4	4	8.

TQ=2

Criteria : "Time Quantum"

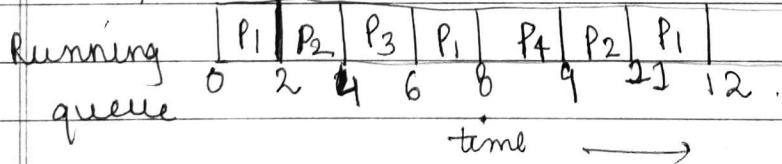

Mode : "Preemptive"

(We have to resume the process not restart it)

Sequence of
process in
Ready queue

P ₁	P ₂	P ₃	P ₁	P ₄	P ₂	P ₁
----------------	----------------	----------------	----------------	----------------	----------------	----------------

context switching (save running process & welcome new process)

1 - 2.8 Scheduling algo.
Preemptive Priority ~~Process~~.

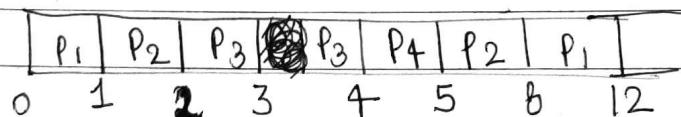

In preemptive scheduling, the tasks are mostly assigned with their priorities.

Priority scheduling is a method of scheduling process that is based on priority. In this algorithm, the scheduler selects the task to work as per the priority.

Equal priority - Round Robin or FCFS.

Priority	Process No	AT	BT	CT	TAT	WT	RT	CPU first
10	P ₁	0	48	12	12	7	0	0
20	P ₂	1	34	8	7	3	0	1
30	P ₃	2	120	4	2	0.	0	2
40	P ₄	4	01	5	1	0	0	4

Higher the no. higher the priority.

0 → P₁ time →

1 → P₁, P₂

2 → P₁, P₂, P₃

3 → P₁, P₂, P₃

4 → P₁, P₂, P₃, P₄

5 → P₁, P₂

L-2.9

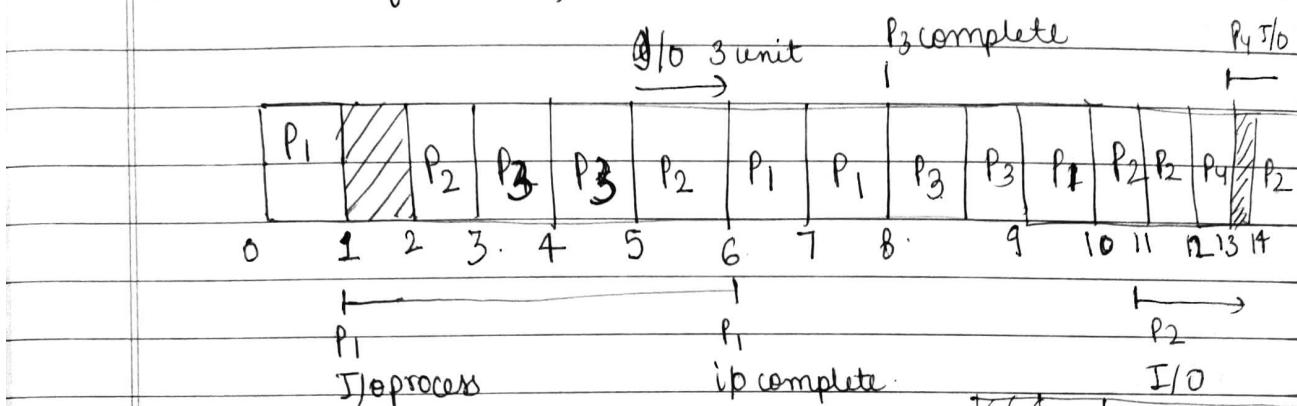

Example of Mix Burst Time (CPU & I/O both) in CPU

Process	AT	Priority	CPU	I/O	CPU
P ₁	0	2	X 0	8 0	3 2 X 0
P ₂	2	3	3 X 1	3	1
P ₃	3	1	2 X 0	3 0	2 0
P ₄	3	4	2	4	1

lowest the no. highest the priority.

Mode: Preemptive

Criteria: Priority based

Find CT of P₁, P₂, P₃, P₄0 → P₁

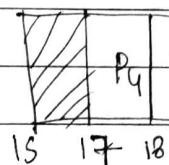

1 → no process

2 → P₂3 → P₃, P₄

↓
high
priority

4 → P₁, P₂, P₃, P₄

5 →

6 → P₁, P₂, P₄8 → P₃, P₁9 → P₁, P₂, P₄

	CT
P ₁	10

P ₃	9
P ₄	18

$$\text{CPU idleness} = \frac{4}{18}$$

$$\text{Usage} = \frac{14}{18}$$

Priority	AT	Priority	CPU	I/O	CPU
P ₁	0	0	20	5	32x 0 X Mode: Preemptive
P ₂	2	3	320	3	Criteria Priority
P ₃	3	1	2X0	3	based.
P ₄	3	4	210	4	

Priority $P_3 > P_1 > P_2 > P_4$

In Ready queue:

I/O events

$P_1 \rightarrow 6$

$P_3 \rightarrow 5$

6 $\rightarrow P_1, P_2, P_4$

7 $\rightarrow P_1, P_2, P_4$

8 $\rightarrow P_1, P_2, P_3, P_4$

9 $\rightarrow P_1, P_2, P_4$

10 $\rightarrow P_2, P_4$

13 $\rightarrow P_2$

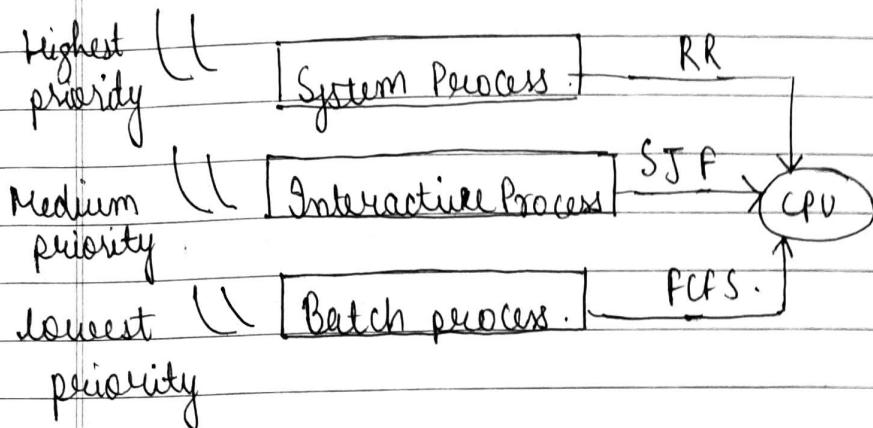

L-2.10

Multilevel queue scheduling

In every scheduling algorithm till now we have taken one queue.

- i) There must be different queue for diffⁿ process
- ii) Every process can have their own algorithms.

- 1) System calls - Round robin
- 2) Interactive calls - SJFS.

Problem :

Lower level or lower priority may experience starvation due to more no of calls on higher priority

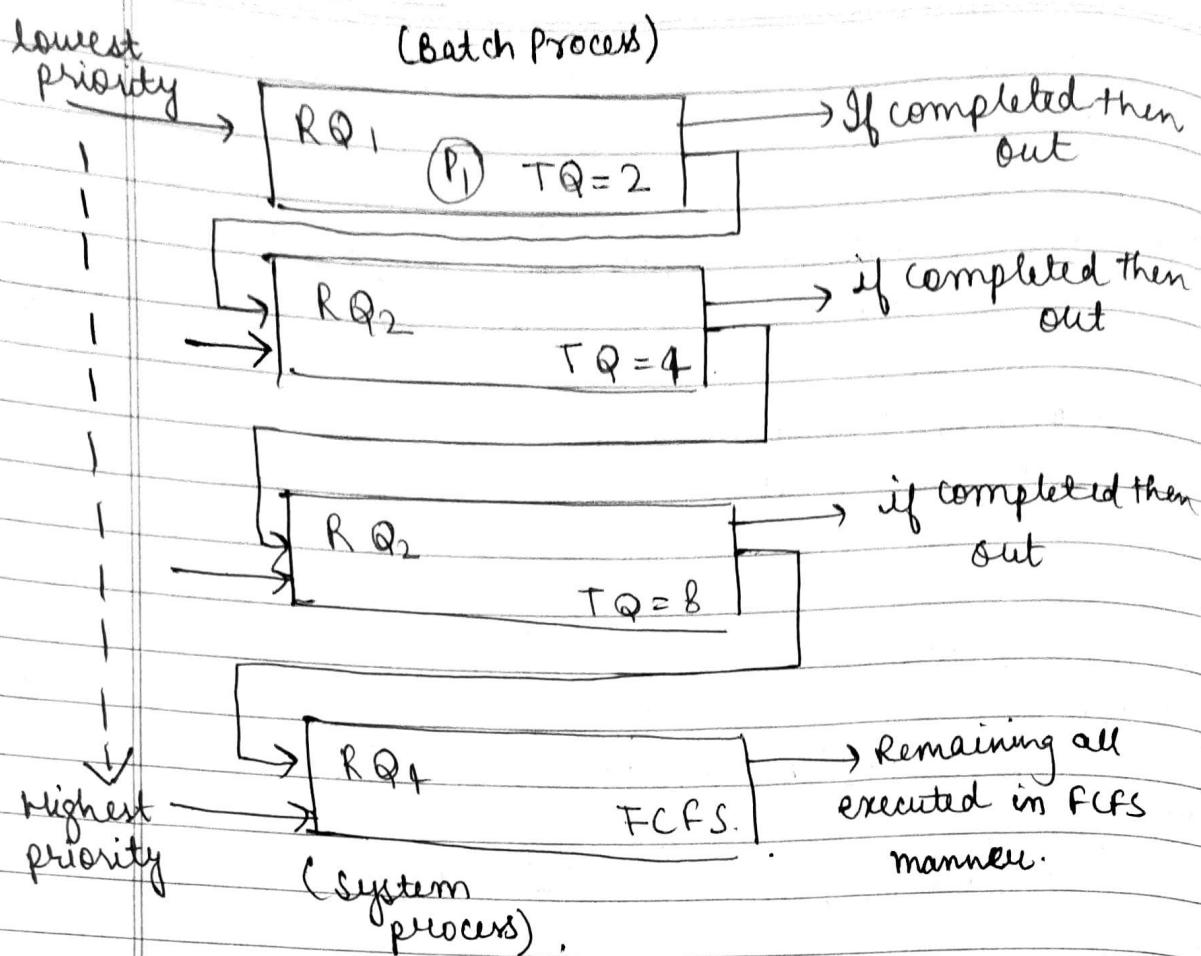

It can be resolved using multilevel feedback queue.

L-2.11

Multilevel Feedback Queue

More system process - lowest priority waits

lowest priority - feedback.

P_1	19	17	13	5
	$TQ = 2$	$TQ = 4$	$TQ = 8$	

Process Synchronization

Processes

Cooperative process

Independent process

One's execution
affects the other
as they share same
or common variable,
memory/buffer, code,
resources

One's execution
doesn't affect other
They have nothing
in common.

Ex - IR UTC

Process Synchronization is used to solve the problem of co-operative process.

int shared = 5, 6 +

context switching P₂

```

graph TD
    subgraph P1 [P1]
        1[int X = Shared; 5]
        2[X++; (x=56)]
        3[Sleep(1); pause]
        4[shared = x; (x=6)]
    end
    subgraph P2 [P2]
        1[int y = Shared; 5]
        2[y--; (y=54)]
        3[Sleep(1)]
    end
    P1 --> P2
    P2 --> P1
    P1 --- Note["when they are parallel."]

```

When they are parallel.

Processes aren't synchronized as the process at last gives either 4 & 6. but it should give 5.

This is called trace condⁿ.

L-3.2

Producers= consumer Problem

Co-operative process

There is one producer that is producing something and there is one consumer that is consuming the products produced by producer. The producer & consumer share the same memory buffer.

$R_p \rightarrow$ Registers

$INCR \rightarrow$ increment

$n =$ size of buffer

Case I. x_1 (producer is processing x_1)

Out

$\emptyset 1$

$(0+1) \bmod 8$

$1 \bmod 8 = 1$

in

$\emptyset 1$

count

$\emptyset 20$

$$(0+1) \bmod 8 = 1$$

$$count = 1 - 1 = 0$$

It forms a circular queue so we used mod n.

Consumer.

0	x_1
1	x_2
2	x_3
3	x_4
4	
5	
6	
7	

Producer

Count	In
3	4

Let x_4 be inserted in the in value.

producer:

$$R_p = 3 \quad \text{load } R_p, m[\text{count}] \quad I_1$$

$$R_p = 4 \quad \text{INCR } R_p. \quad I_2$$

If after INCR R_p the process gets preempt

$$\text{Resuming } R_p = 4 \quad I_3$$

Let x_1 be consumed.

$$\text{load } R_c, m[\text{count}] \quad R_c = 3 \quad I_1$$

$$\text{DEC } R_c \quad R_c = 2 \quad I_2$$

$$\text{Resuming } R_p = 2 \quad I_3$$

I_1, I_2 consumer I_1, I_2 producer. I_3 consumer I_3 .

There are 3 items in buffer but count says only 2 values is there, there is race condn. so we can't achieve process synchronization.

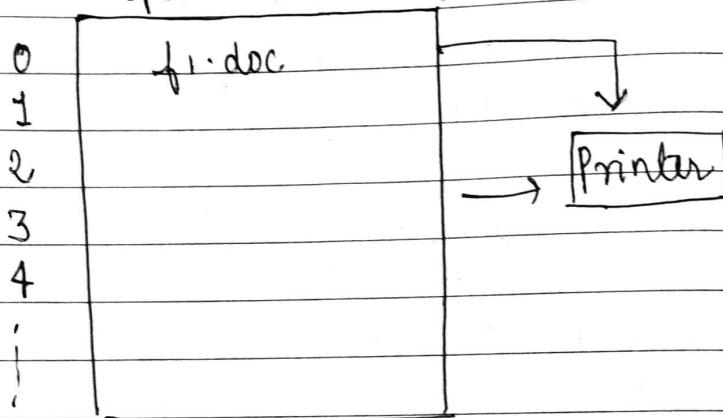

L - 3. 3.

Printer-Spooler Problem

multiple programs → spoolers → take items sequentially → give to the printer

1. Load $R_i, m[in]$
2. store $SD[R_i], "F-N"$
f1.doc
3. $TNCR R_i$
4. Store $m[in], R_i$

Spooler Directory

Different solⁿ for process synchronization

4 conditions

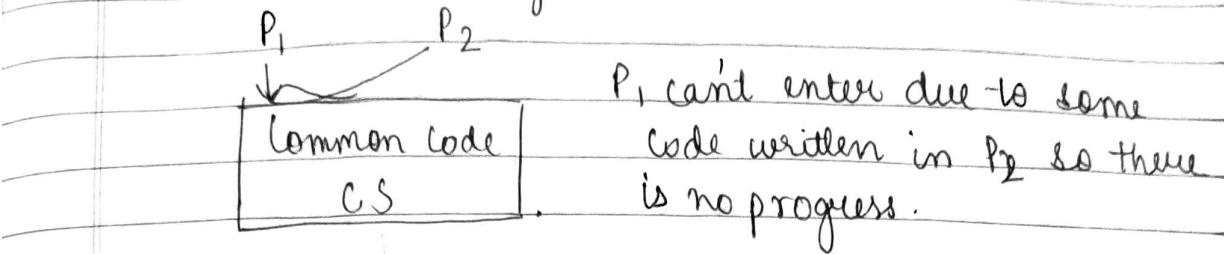

- 1) Mutual Exclusion }
- 2) Progress }
- 3) Bounded wait
- Secondary 4) No assumption related to H/W speed

Mutual Exclusion → If P₁ or P₂ is inside critical section the P₂ or P₁ is not allowed to enter in

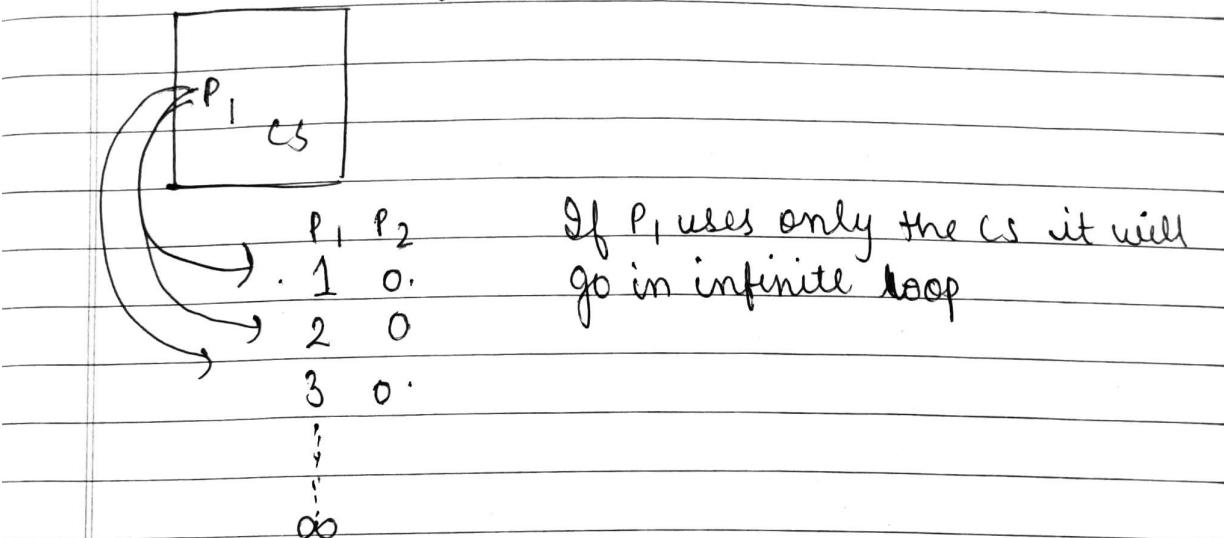

P₁ P₂ critical section.

2. Progress \rightarrow When both can use common code there's progress.

3. Bound Wait - There shouldn't be a condition of starvation as one process uses the CPU every time. Let every process use the CPU.

4) H/w speed - Every solution should be portable and universal. There shouldn't be anything dependent on H/w speed.

Now solution to critical Problem

L-3.5.

Critical section solⁿ: using LOCK.

CS - critical section

Date _____ / _____ / _____

do {

acquire lock.

CS

release lock

}

↑ entry code

1. while($LOCK == 1$);
2. $LOCK = 1$

3. Critical Section

4. $LOCK = 0$.

With preemption (context switching)

$$\text{Empty} = 5 \& 5$$

$$\text{full} = 3 \& 2 \quad (\text{consumer in CS})$$

$$S = 1 \& 1 \& 0$$

$$Out = 0 \& 1 \quad \hookrightarrow \text{consumer can't do down of } S.$$

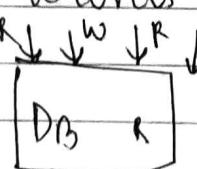

$$In = 3 \& 4$$

3.12 → Solution of Readers writers problem.

We have a database used by Reader & writer

Reader - who only reads the data

Writer - who wants to update the data also.

(Same data)

R-W (problem)

W-R (problem)

G-W (problem)

R-R (no problem)

Date _____ Read count
no of readers in buffer.

int $RC = 0$;
Semaphore mutex = 1;
Semaphore db = 1;
Void Reader(void)
{
while (true)
{
down(mutex);
 $RC = RC + 1$;
if ($RC == f$) then
down(db);
up(mutex);
process data
exit
}
}
Void writer(void)
{
while (true)
{
down(db);
DB
up(db);
}
}.

To synchronise problem we used Semaphores.

Case 1: R_1 comes first

$RC = 0 \& 1$ mutex = 1 & 1 db = 1 & 0

down(mutex)

DB R_1

For writer

$RC = 1$ mutex = 1 db = 0

down(db)

$db \neq -1$ so the process gets blocked.

Case 2: W_1 comes first

Date: _____

$$R_c = \emptyset \times 1 \quad \text{muter} = X 0 \cdot \quad db = X 0$$

down(db)

$db \neq -1$ can't be negative
so r, gets blocked.

Case 3: write-write problem

when writer w₁ comes down(db) $db = X 0$.

when w₂ comes $db \neq -1$ so it gets blocked.

Case 4: Read - Read

$$R_c = \emptyset \times 2 \quad \text{muter} = X \emptyset \times \emptyset 1 \quad db = X 0$$

| D_B R₁ R₂ |

2 = 1 no

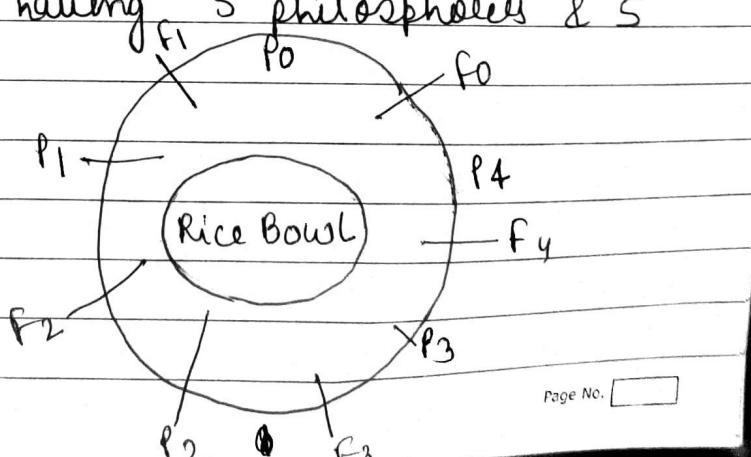

down(muter)

db; X

up(muter)

3.13 Dining Philosophers Problem.

A dining table having 5 philosophers & 5 forks

void philosopher (void)

{

while (true)

{

Thinking();

table_fork(i); \leftarrow left fork

table_fork((i+1) % N); \leftarrow Right fork

EAT();

put_fork(i);

Put_fork((i+1) % N);

}

}

Philosopher \rightarrow think
 \searrow eat

Case 1: P₀ comes

i = 0

left fork = 0 (f₀)

right fork = (0+1) % N = 1 (f₁)

Eating

f₀

f₁

end.

Case 2: P₁

i = 1

left fork = 1 (f₁)

right fork = 2 (f₂)

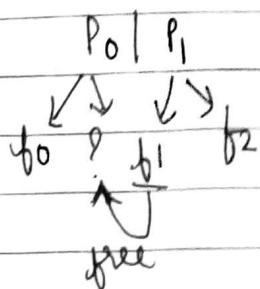

Eating

f₁

f₂

Case 3:

problem of race cond " occurs.

 $S[i] \rightarrow$ use array of SemaphoresSo $S_0 S_1 S_2 S_3 S_4$

Initially $\begin{matrix} & & & & \\ \times & \times & 1 & 1 & 1 \end{matrix}$ (Initialize every semaphore with 1 when initialized with 0, it waits)

Now $\begin{matrix} & & 0 & 0 \\ & & | & | \end{matrix}$

void philosopher(void)

{

while (True)

{

Thinking();

Wait (table-fork(i))

Wait (table-fork((i+1) mod N))

EAT();

Signal (Put fork(i));

Signal (Put fork((i+1) mod N))

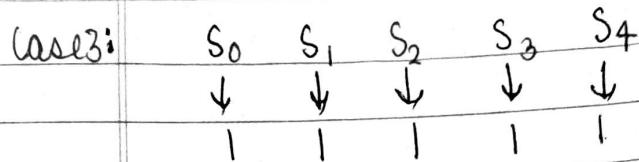

};

}.

$P_0 \rightarrow S_0 S_1$
$P_1 \rightarrow S_1 S_2$
$P_2 \rightarrow S_2 S_3$
$P_3 \rightarrow S_3 S_4$
$P_4 \rightarrow S_4 S_0$

~~Race condition~~

But in ab P_0 & P_2 can come. It is a special case of mutual exclusion as P_1 & P_2 are independent of each other.

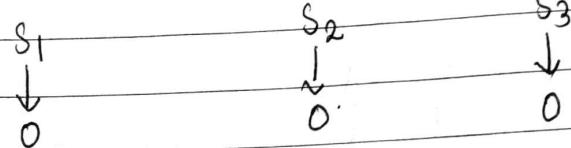

P_0 comes first

It gets preempt

P_1 comes P_2 comes P_3 comes

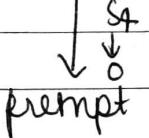

preempt

preempt

preempt

P_4 comes

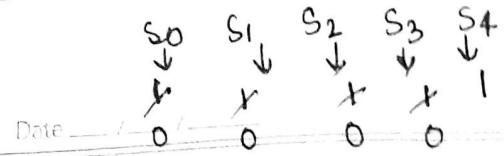

for eight fork (blocked)

The take left hand side fork belt gets blocked for the right one. This situation is called deadlock (All process gets blocked)

Q: How to remove deadlock?

On changing the sequence of one process.

$P_4 \quad S_0 \quad S_4$

blocked $\rightarrow P_4$

$s_0 \quad s_4$

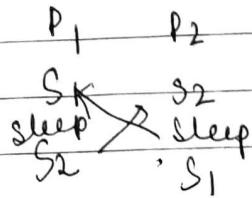

We can change sequence of any philosopher.

N^{th} philosopher:

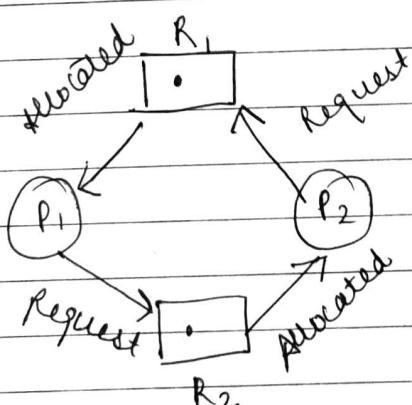

Wait (take_fork ($S(i+1) \bmod N$))

wait (take_fork (s_i));

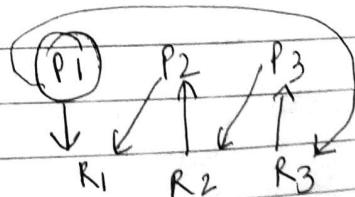

4.1 Deadlock concept

If two or more process are waiting on happening of some event which never happened we say these processes are involved in a deadlock then that state is called deadlock.

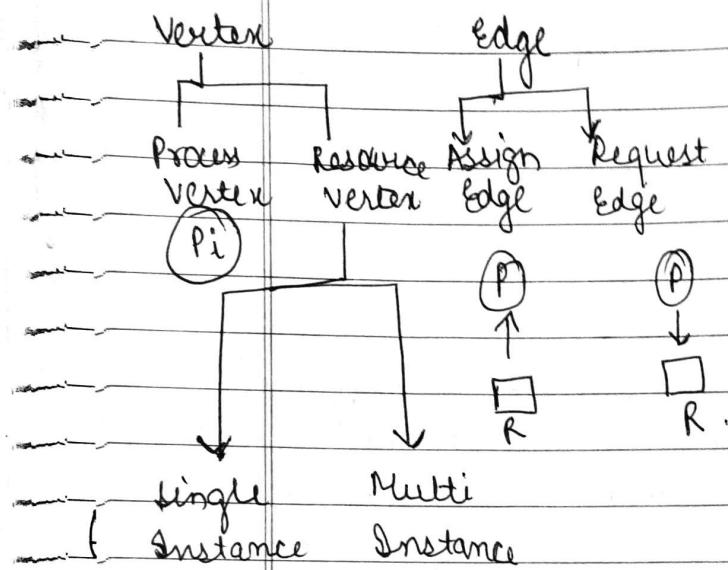

$R_1 \rightarrow P_1$
 R_1 is allocated to P_1
 P_2 request for R_1

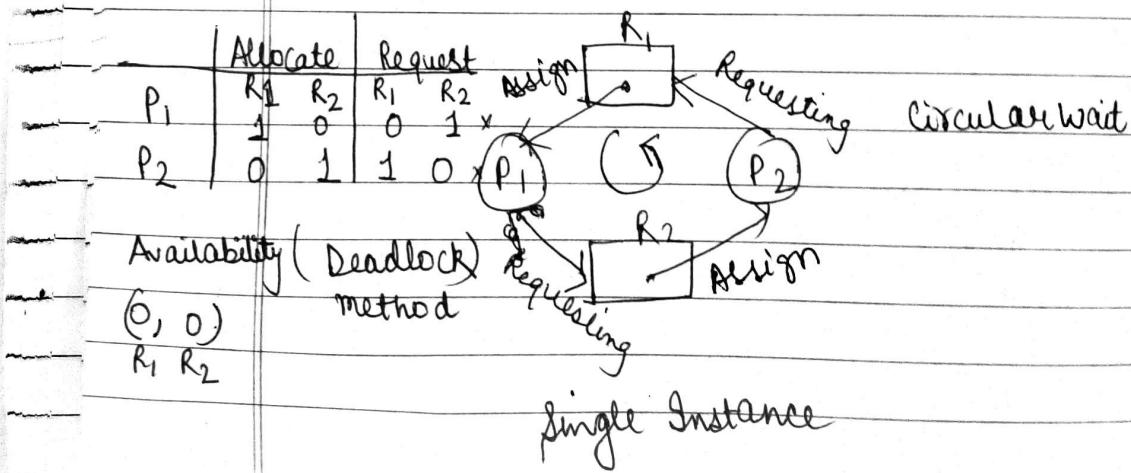

Necessary conditions for deadlock.

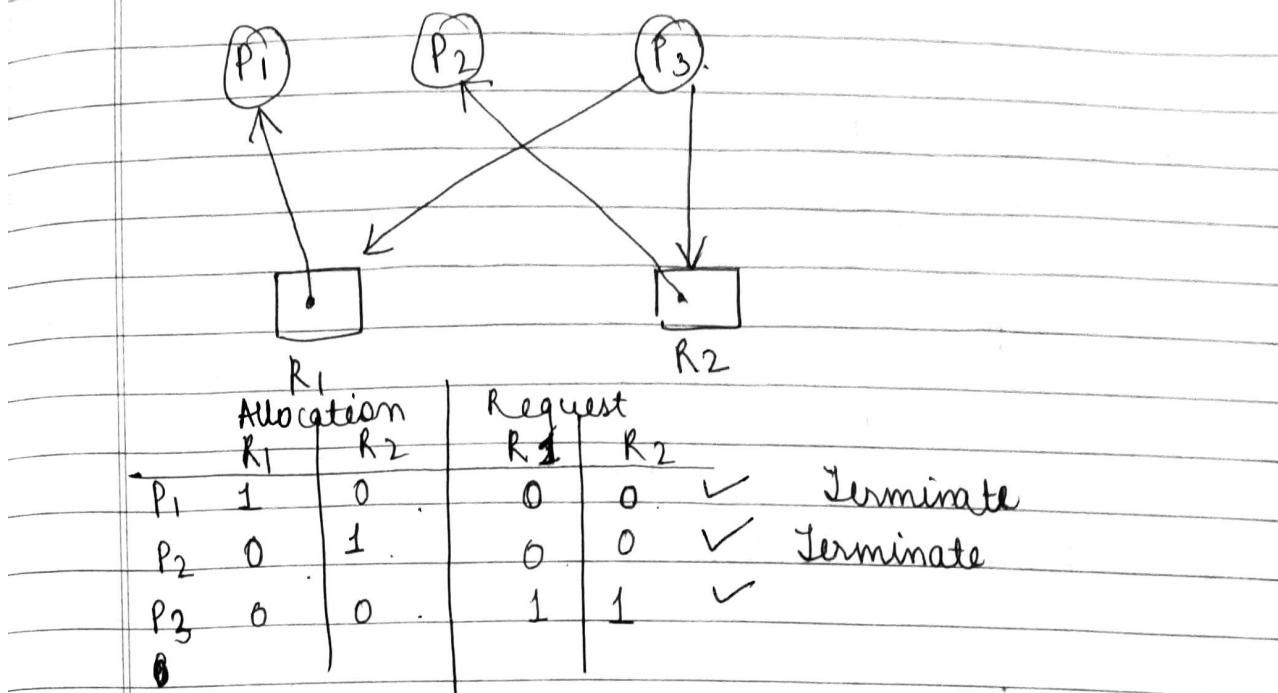

- 1) Mutual Exclusion
- 2) No Preemption
- 3) Hold & wait
- 4) circular wait

4.2 Resource Allocation Graph in Deadlock (RAG)

eg: CPU eg : Register
Monitor

Availability (0, 0)

(1, 0) → after P₁ terminate

(1, 1) → after P₂ terminate

No deadlock occurs.

Waiting
 finite (Starvation)
 infinite (Deadlock)

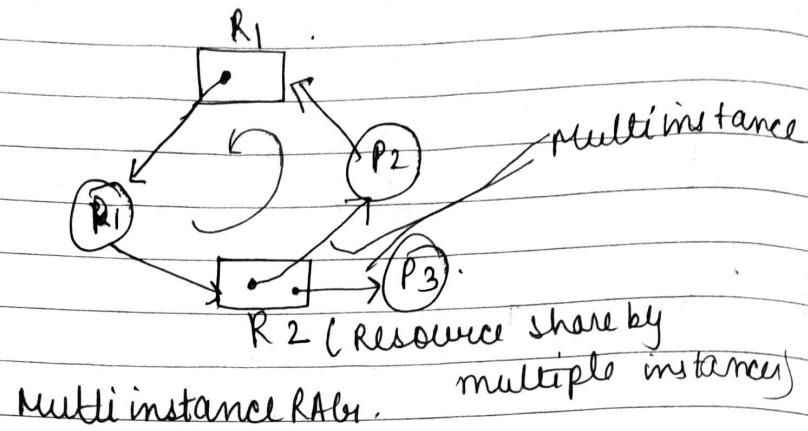

If RAG (Circular wait) cycle → Always in Deadlock

↓
 A single instance

Single instance + Circular wait = Deadlock.
 Multi instance + CW = Possible (may or may not)

Date _____ / _____ / _____

4.3 Multiminstance RAGs.

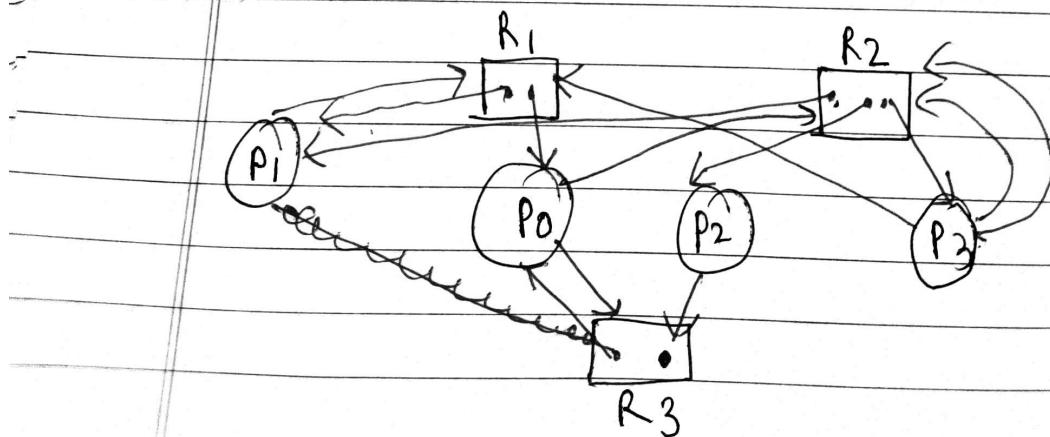

Process	Allocate		Request	
	R ₁	R ₂	R ₁	R ₂

P ₃	0	1	0	1	2	0

curr aw = R₁ R₂ R₃

$$(0 \ 0 \ 1)$$

P₂ → 0 0 1 0

0 1 1

P₀ → $\frac{1 \ 0 \ 1}{1 \ 1 \ 2}$

R₁ R₂ R₃
 1 1 2

P₁ 1 1 0

→ No deadlock in the system.

P₃ 0 1 0

2 2 2
 2 3 2 - curr availability

P₂ → P₀ → P₁ → P₃

4.4 Deadlock Handling methods

1. Deadlock ignorance (Ostrich method)
2. Deadlock prevention
3. Deadlock avoidance (Banker's Algo)
4. Deadlock detection & Recovery

Deadlock ignorance
↓

(Just ignore the deadlock)

Deadlock occurs very rare. Windows has lots of code in this. We want more & more speed so we don't write any code for deadlock, so it's easy to avoid at its rare.

Why ostrich method called?

Whenever there is a sand storm Ostrich puts its head in the sand assuming no sand. In the same way we ignore deadlock so that the performance & speed doesn't gets degraded.

Deadlock prevention

Before the deadlock occurs find the prevention 4 necessary conditions for deadlock

- 1) Mutual Exclusion
- 2) No preemption
- 3) Hold & wait
- 4) Circular wait

either remove all the conditions or set to false any one of the situation.

- 1) Mutual exclusion (there should be no sharing b/w diffⁿ process at same time).

So, if we make all resources sharable we can remove mutual exclusion but some resources like printer can't be made sharable.

- 2) No preemption (there should be any preemption w/in b/w the resources)

So, if we make the process preempted using timestamp or TQ we can prevent deadlock.

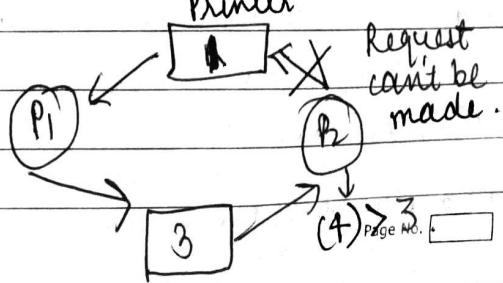

- 3) Hold wait (holding some resource & waiting for some resources).

Before the process starts, give all the resources to the process.

- 4) Circular wait

Order all the resources (like numbering). Whenever a process request for a resource it would be ordered in increasing order. A process can request in increasing order.

1. Printer
2. Scanner
3. CPU
4. Register

Deadlock Avoidance

while giving the resource to the process check its safe or not.

Deadlock detection & Recovery

Step 1: Firstly check whether there is a deadlock or not using RAG (Resource Allocation graph).

Step 2: After detection do some recovery

- 1) kill the processes or a process (lower priority resource)
- 2) Resource preemption (preempt the resource it is holding)

4.5 Deadlock Avoidance

(Banker's Algorithm)

Deadlock Avoidance Algorithm

while providing the resources to the process we check if deadlock occurs or not. It is also called Deadlock prevention.

$$CPU(A) = 10 \quad (7)$$

$$Memory(B) = 5 \quad (2)$$

$$Printer(C) = 7 \quad (5)$$

(Total AT) Allocation \rightarrow how much is allocated

Max Need \rightarrow how much is needed

(Total AT - A) Availability \rightarrow how much resource is available

(Max Need - Allocation) Remaining Need

Process	Allocation			Max Need			Available			Remaining need Max Allocation		
	(10-7)	(5-2)	(5-3)	A	B	C	A	B	C	A	B	C
→ P ₁	0	1	0	7	5	3	3 (1)	3 (1)	2 (0)	7	4	3 ✓
→ P ₂	2	0	0	3	2	2	5 (2)	3 (1)	2 (1)	1	2	2 ✓
→ P ₃	3	0	2	9	0	2	7 (0)	4 (0)	3 (2)	6	0	0
→ P ₄	2	1	1	4	2	2	7 (0)	4 (1)	5 (0)	2	1	1 ✓
→ P ₅	0	0	2	5	3	3	7 (0)	5 (0)	5 (0)	5	3	1 ✓
+							10	5	7			
	7	2	5									

If we can't fulfil need of every process it is called deadlock.

P₂ → P₄ → P₅ → P₁ → P₃ (safe sequence)

(Sequence having
no deadlock)

In real life it is not possible.

4.6. Create Question.

Process	Allocation			Max			Available			Remaining need		
	A	B	C	A	B	C	A	B	C	A	B	C
P ₀	1	0	1	4	3	1	3 (1)	3 (0)	0 (1)	3	3	0 ✓
P ₁	1	1	2	2	1	4	4 (1)	3 (0)	1 (2)	1	0	2 ✓

1	1	1
{x}	{x}	{x}

P ₁	P ₂	P ₃
1	1	1

→ deadlock can occur

R = 4

P ₁	P ₂	P ₃
1	1	1
1	1	1
x	x	x

→ Deadlock never occurs.

$$(\min \text{req}) + 1$$
$$3 + 1 = 4$$

Max^m resources allocated still deadlock - 1

$$\begin{array}{ccc} P_1 & P_2 & P_3 \\ 3 & 4 & 5 \\ 2 & 3 & 4 = (4+3+2) + 1 \\ & & = 10 \end{array} \quad (\min \text{req})$$

Max^m resources allocated still deadlock = 9

4.8 Create Question on Deadlock.

- Q. Consider a system with 3 processes that share 4 instances of same resource type. Each process can request a max. of ' K ' instances. The largest value of ' K ' that will always avoid deadlock is $\rightarrow 2$.

$$R = 4 \text{ units of } R$$

	P_1	P_2	P_3
$K=1$	1	1	1

	P_1	P_2	P_3
$K=2$	1 1	1 1	1 1

	P_1	P_2	P_3
$K=3$	1 1 1	1 1 1	1 1 1
	x	x	x
	1	1	1

	P_1	P_2	P_3
$K=3$	1	1	1
	1	-	-
	-	-	-

Deadlock

Ans. 2.

Another method to find

'R' resources

'n' processes ($P_1, P_2, P_3 \dots P_n$)

'd' demand ($d_1, d_2, d_3 \dots d_n$)

max^m resources but still deadlock

$$\begin{array}{ccc} P_1 & P_2 & P_3 \\ 2 & 2 & 2 \\ 1 & 1 & 1 \end{array} = 6.$$

$= 3 + 1 = 4$ (free from deadlock)

$$(d_1 - 1) (d_2 - 1) (d_3 - 1)$$

$$R \leq \sum_{i=1}^n d_i - n. \quad (\text{there will be a deadlock})$$

$$R \geq \sum_{i=1}^n d_i - n \quad (\text{there will be no deadlock})$$

$$R + n > \sum_{i=1}^n d_i$$

↓ ↗ total demand
total resource total processes

$$4 + 3 > 3 \times 2$$

$$7 > 6 \rightarrow \text{True}$$

4 processes
4 resources

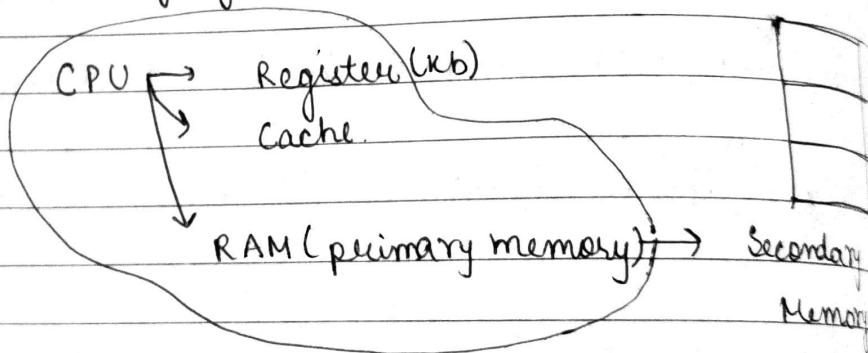

$$4+4 > 4 \times 1 \\ 8 > 4 \quad (\text{Valid})$$

$$4+4 > 4 \times 2 \\ 8 > 8 \quad (\text{false})$$

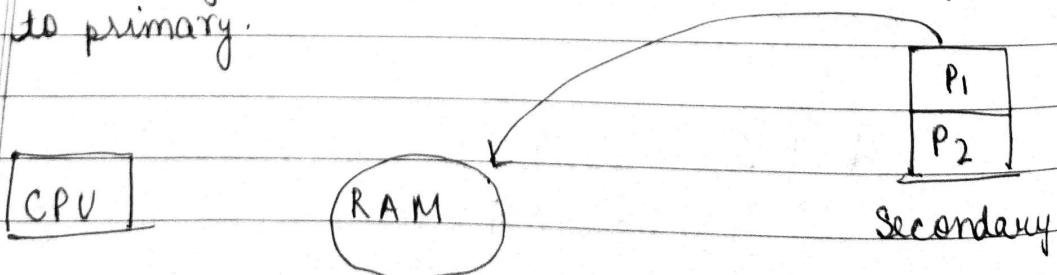

5.1 Memory Management and Degree of Multi programming

It is a kind of functionality to manage all the memory resources in a more & more efficient manner.

Method of managing primary memory.

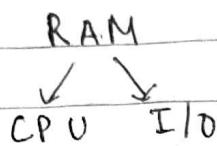

Secondary memory is not directly connected with CPU because secondary memory is a bit slower in comparison to primary.

multi programming - whenever we are giving the programs in RAM being more process in main memory.

More process in RAM, degree of multiprogramming increases.

(More & more processes in RAM to increase efficiency)

When we bring a processes. P₁ & if it wants to have some I/O then CPU shouldn't be idle.

RAM Process

$k \rightarrow$ I/O operation (70%)

CPU = $(1-k)$ (30%)

$$\frac{4}{4} = 1$$

utilization

RAM Process

$k^2 \rightarrow$ I/O operat^n.

CPU utilization = $(1-k^2)$

$$\frac{8}{2} = 2 \text{ Process.}$$

$$= 1 - (0.7)^2 \\ = 76\%$$

$$k = 70\%$$

RAM Process

$k^4 \rightarrow$ I/O operat^n.

CPU utilization = $1 - (0.7)^4$

$$= 93\% \text{ approx}$$

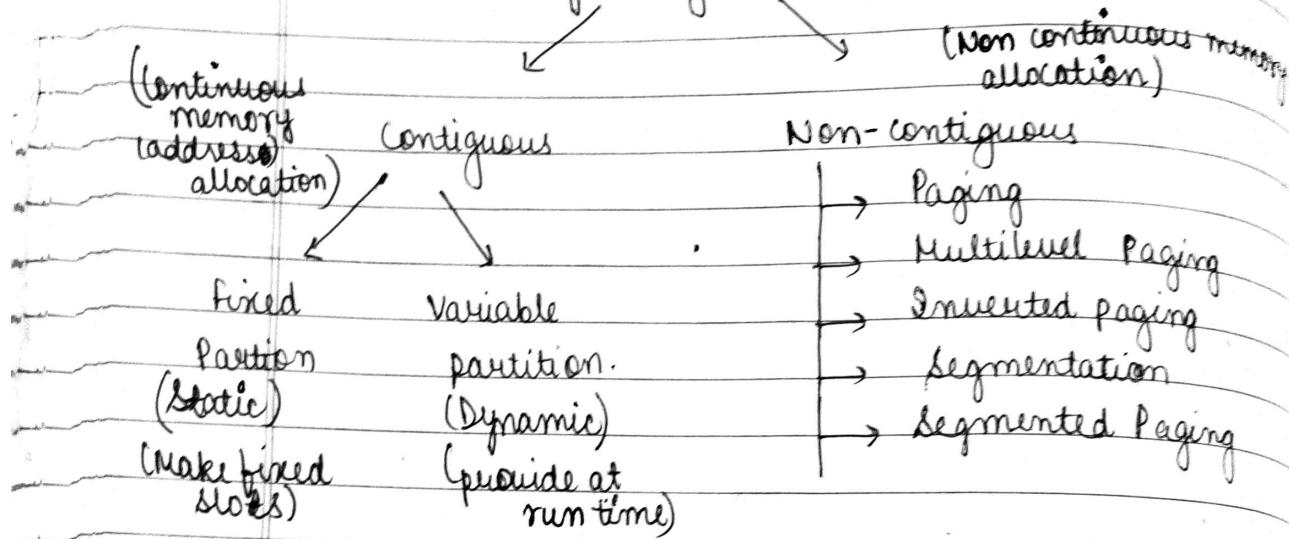

Efficiency increases

$$\frac{16}{4} = 4$$

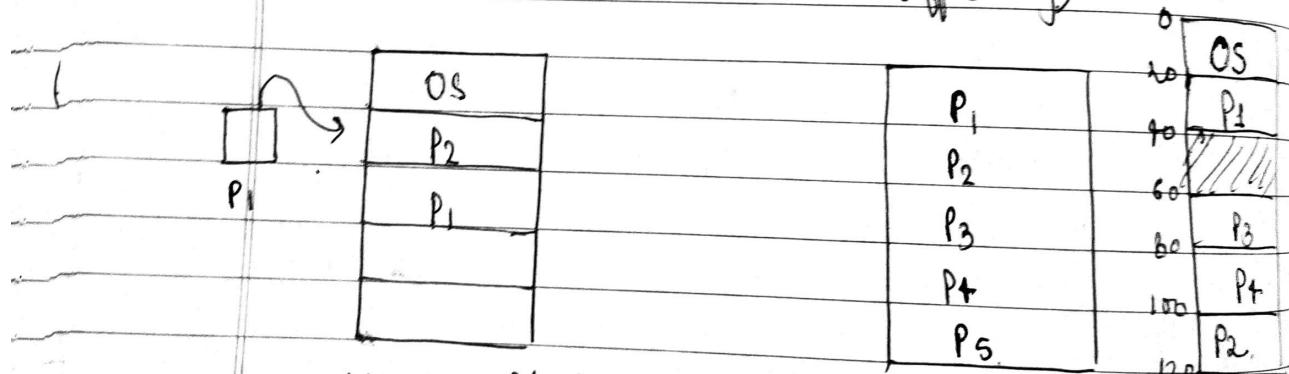

- * Increase the no of processes as well as RAM of the system
- * OS needs to pay attention to allocation & deallocation.

5.2 Contiguous and non contiguous.

Memory management Techniques

Ready state process & CPU utilization (efficiency)

Memory Blocks
(RAM)

Contiguous
allocation

Memory
Block

Non-contiguous
allocation

5.3 Internal fragmentation | Fixed size Partitioning

Whenever the process are coming into RAM, how we are allocating it the space.

Points to remember.

- 1) No of partitions are fixed
- 2) Size of each partition may or may not be same.
- 3) Contiguous allocation so spanning is not allowed.

* No of size of partitions may differ or be same. No of partition is always same.

We can put process in any partition taking into consideration its size should be less than partition size.

	OS.	OS.
0	4MB	8MB
1	6MB	8MB
2	8MB	8MB
3	16MB	8MB

When we allocate any process to the partition. But after allocating process we get some extra memory which is wasted. It is called ~~process~~ Internal fragmentation.

Although we having extra extra memory for diff n. partition
we couldn't accommodate a process in pieces for that
fragments.

Limitations

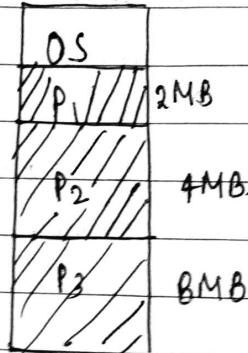

- 1) Internal fragmentation
- 2) limit in process size.
- 3) limitation on degree of multiprogramming.
We can't bring more and more processes.
- 4) External fragmentation

5.4 Variable Size Partitioning

Ram is empty. At run time processes are allocated to
the Ram at runtime.

$$P_1 = 2 \text{ MB}$$

$$P_2 = 4 \text{ MB}$$

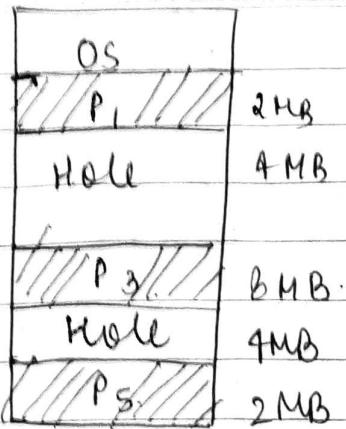

Notes

- 1) No internal fragmentation
- 2) No limitation on number of processes.
- 3) There is no limitation on the process size.

Limitations

- 1) External fragmentation occurs. We can remove it using compaction (one process is copied & pasted to other location)
but it takes very much time.
- 2) Deallocation creates Hole. Allocation & deallocation is difficult.
- 3) lot of holes is created

In which we should put which process.

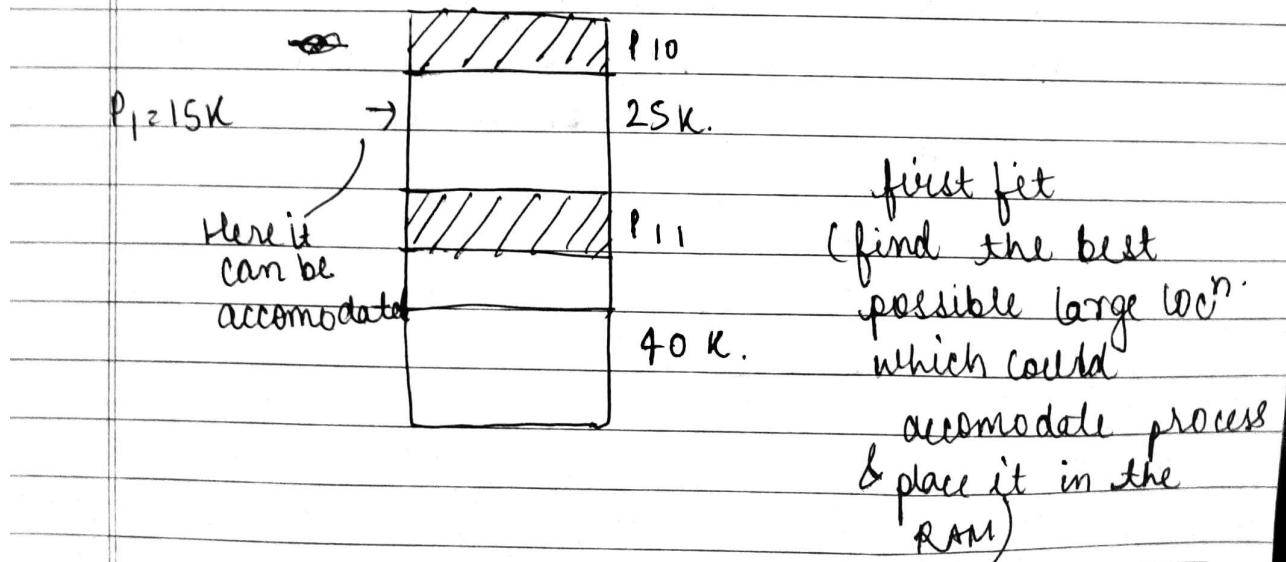

5.5 First fit, Next fit, Best fit
Worst fit

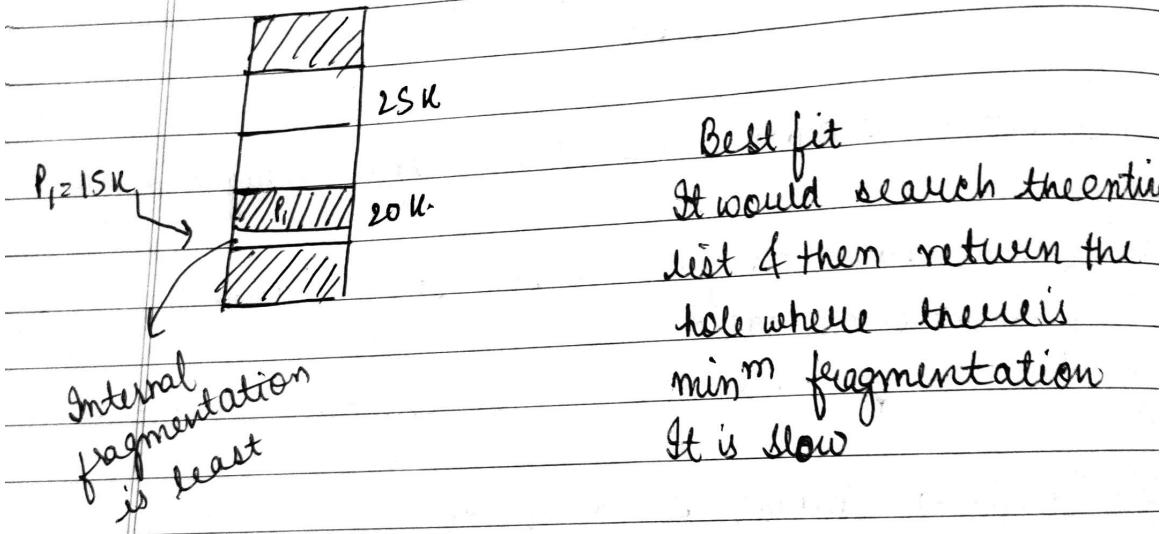

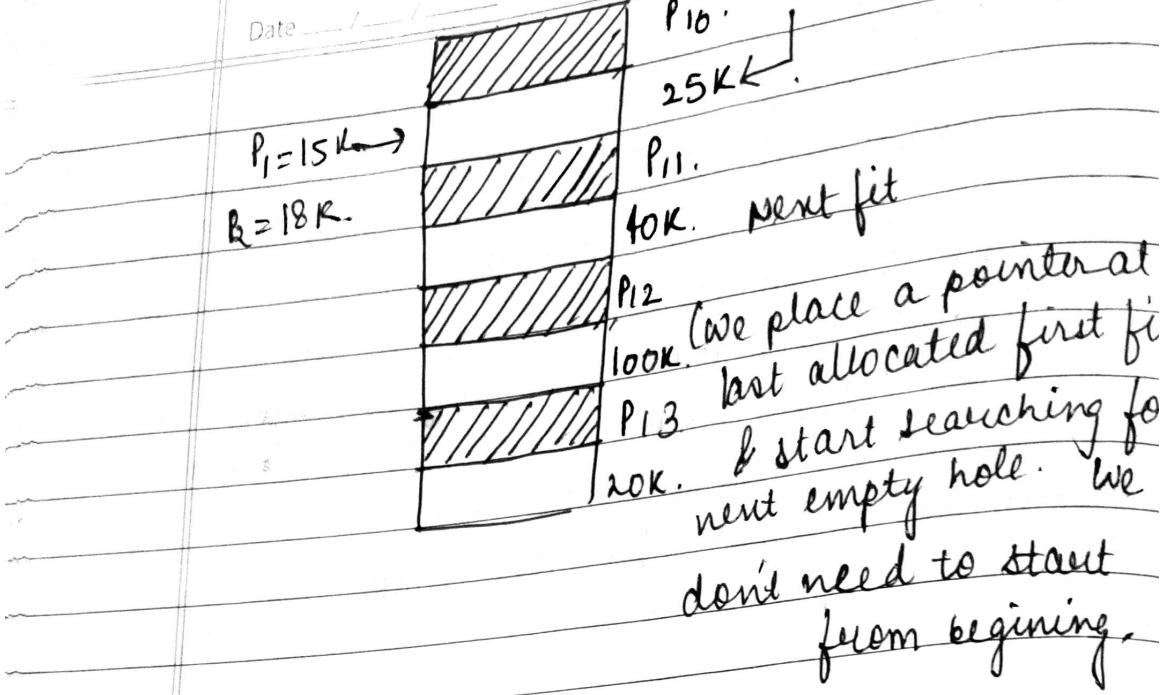

First fit \rightarrow Allocate the first hole that is big enough

Next fit \rightarrow Same as first fit but start search always from last allocated hole.

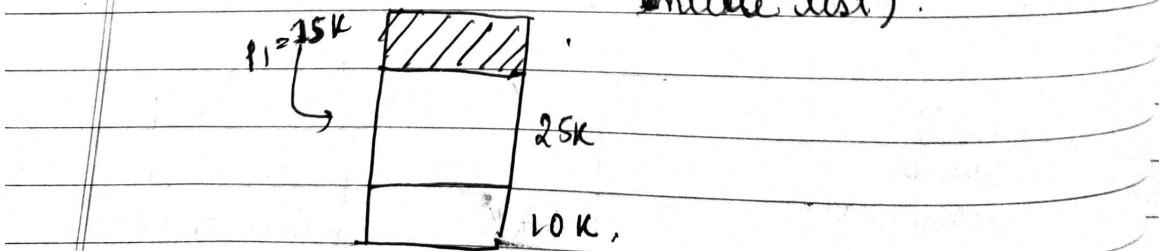

Best fit \rightarrow Allocate the smallest hole that is big enough

Worst fit \rightarrow Allocate the largest hole.

worst fit - It would search the entire list but would search the biggest hole among every partitions. (Slow due to searching of entire list).

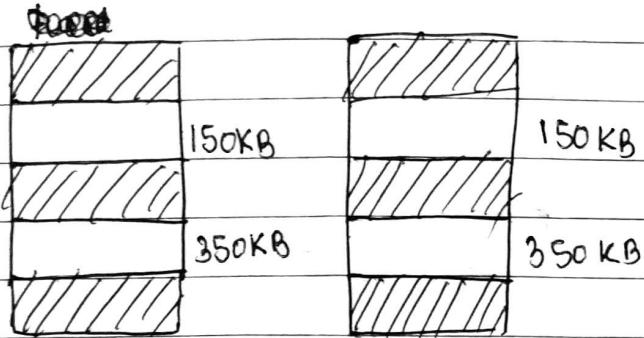

5.6. Create Question on ~~fit~~ fits

Q. Request from processes are 300K, 25K, 125K, 50K respectively. The above req. could be satisfy with.

- a) best fit but not first fit
- b) first fit but not best fit
- c) Both
- d) None

Req. No	J ₁	J ₂	J ₃	J ₄	J ₅	J ₆	J ₇	J ₈
Request size	2K	14K	3K	6K	6K	10K	7K	20K
Usage time	4	10	2	8	4	1	8	6

calculate the time at which J₇ will be completed

- a) 17 b) 21 c) 19 d) 20

M/M

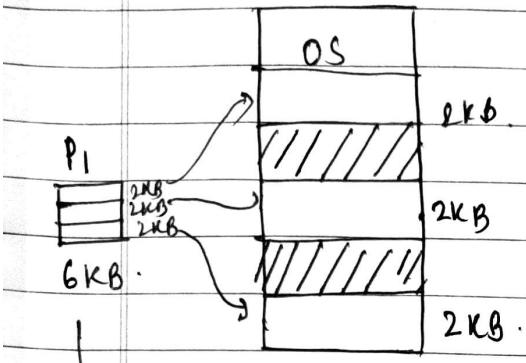

In case of J₅ & J₆ we would take out the one which is completed first. And then put it & calc. the final time by initial + usage-time.

5.8 Need of Paging (Non contiguous Memory Allocation)

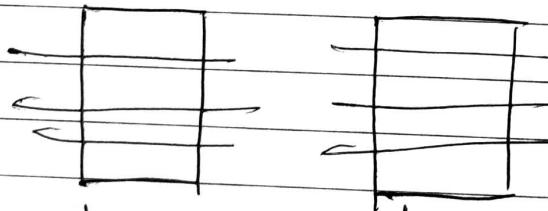

A process can be spanned & put up in fragments in different memory location.

process is divided accⁿ to the hole size but the hole size changes on runtime so its a bit time consuming (division of process)

process is divided & put up in diff. locations. So a process is divided before it gets memory in pages.

When we do partition of process in secondary memory it's called paging while when we do partition of process in RAM it is called framing.

paging
(Secondary memory)
frames.
Mem (RAM)

THANK YOU
